The annual report of the Department of Internal Affairs for the fiscal year ending Nov. 30, 1893, gives the assessed valuation of real estate in Pennsylvania for the year ending June 1, 1892, at \$2,308,767,431, or \$42,422,606 less than for the year ending June 30, 1893. This is estimated as about 60 per cent. of the actual value. It does not cover the property of those public corporations whose real estate is not taxed for local purposes, these taxes being paid direct into the State treasury, or include the valuation of municipal corporations, school districts, and property devoted to religious worship.

A census statement shows that the valuation of farms decreased from 1880 to 1890 by \$53,449,177. The amount at the latter date was \$922,240,233. There has been a corresponding decrease in the value of farm products in the estimate made in 1890 with that made in 1880.

Banks.—The report of the Superintendent of Banking for the fiscal year ending Nov. 30, 1893, shows that there are 80 banks, 16 savings institutions, and 82 trust companies under supervision of the banking department, an increase of 6 over

the previous year. Three banks—Farmers' Bank, Harrisburg, State Bank of Lock Haven, and Lebanon Trust and Safe-Deposit Bank—were forced to discontinue business. Of the 82 trust companies reported, two have gone into liquidation; a number of private banks, which were not subject to supervision under State laws, were swept out of existence by the panic.

The report shows that the amount of capital invested in the financial institutions of the State during the past year has increased \$1,940,545 compared with the previous year.

The Order of Solon.—The State Commissioner of Insurance gave out in December the result of an official investigation of this order. He has no legal authority or supervision over societies of this kind except under the act of April 6, 1893, authorizing him to examine their books and papers. He said:

The Order of Solon was incorporated in May, 1888, and contracted with its members to pay them \$25 per week sick benefits, \$500 in case of total disability, and \$1,000, less any sums that may have been paid on account of sick benefits or disability claims, at the end of seven years, and all for the small sum of \$2.50 per month, or \$210 for the whole endowment period of seven years. The management has not been strikingly able, but it has been able enough to make 10,601 persons residing in six different States—mostly in Pennsylvania—believe they could get something for nothing. That large number of presumably intelligent persons have paid into this concern in four and one half years the enormous sum of \$585,244.52. The outstanding contracts of the society, after deducting probable lapses, show a future liability of \$5,484,600, which will begin to mature in less than sixteen months. The net available assets of the society with which these millions are to be paid amount to \$144,549.06. The books and accounts have been loosely kept, the finances have been grossly mismanaged, and the whole affair, when fully known, will form one of the most interesting pages in the history of life insurance in Pennsylvania.

Education.—The Superintendent's report for the school year ending June 5, 1893, gives the following statistics: School districts, 2,886; schools, 24,012; graded schools, 12,304; male teachers, 8,245; female teachers, 17,718; whole number of teachers, 25,963; average salaries of male teachers per month, \$43.94; average salaries of female teachers per month, \$33.04; pupils, 994,407. Total cost of tuition, building, fuel, and contingencies, \$16,410,976.99.

The report of the State normal schools gives the whole number of students for the past year as 5,918; number graduated who intend to become teachers, 931; total value of property, \$2,626,103.93. The last Legislature enacted a law directing the Superintendent of Public Instruction to grant without examination permanent State certificates to all applicants therefor who are graduates of recognized literary or scientific colleges legally entitled to confer degrees, and have taught in the public schools for three full annual terms. This raised a question as to what constituted the legal power to confer degrees. Graduates of several small colleges applied for certificates. One college represented has six pupils and two teachers—the principal and his wife—and has conferred degrees. The question was referred to the Attorney-General.

Insane Asylums.—A joint committee appointed by the Legislature to investigate the con-

struction of the new State insane asylum at Wernersville reported that they believed the foundations would not bear half the weight to be supported. The contract provided that the walls should be constructed of local material, but it is said that much of the stone used was picked up in the fields in the vicinity of the asylum. Members of the committee said that in some places they were able to pull round stones out of the walls with their hands. They recommended that the entire structure be pulled down. The report caused surprise because the building commission appointed by the Governor had announced that the structure was well built and in good condition.

School for Soldiers' Orphans.—The Legislature made provision for an industrial school for indigent soldiers' orphans. The *per capita* rate of appropriation for the education and maintenance of the children admitted to the industrial school shall not exceed \$200 a year. Scotland, in Franklin County, was chosen as the site of the school. The ground will cost \$12,500. The commission expects to have the new school ready for occupancy within a year. Applications are already on file for the admission of a large number, including those now in the soldiers' orphans' schools, eligible to admission. At present the schools are almost filled to their capacity. There are 215 pupils at the Chester Springs school, 149 at Hartford, 177 at Uniontown, 1 in St. Paul's Home, Philadelphia, and 2 in the training school for feeble-minded children at Elwyn. The schools are in good condition and the children are reported to be happy and contented. The building now planned will accommodate 250 to 300 children.

The Columbian Exposition.—Pennsylvania's appropriation for her exhibit was \$300,000, of which all but \$3,438.86 was expended. The commission decided to sell the building. The highest bid for it was \$2,500, and it was sold for that. Sales of furniture and other articles brought up the amount to \$8,700.

Rain and Floods.—Heavy rains in May caused unprecedented floods in the northwestern part of the State. Meadville, Erie, Newcastle, and Titusville were among the places under water. Trains were stopped and business suspended, and immense damage was done to property.

Mining.—Reports of accidents for 1893 in the mining districts show that it was marked by a smaller number of fatal accidents than is usual, though the list is still very large. Six of the 7 anthracite districts (the seventh not having been reported at the end of the year) show a total of 1,291 accidents, and 352 lives lost.

Labor Troubles.—There was a general strike of the employees of the Lehigh Valley Railroad Nov. 18, which affected the whole line from New York to Buffalo, with the greatest trouble, apparently, at Wilkesbarre. The cause was explained to be that articles which were agreed upon at Bethlehem in August at a conference were not posted on the bulletin board and carried into effect. In addition to this, the chairman of the grievance committee said it was agreed that engineers in round-yard service were to have a uniform rate of \$3.25 a day; but the bulletin classified them at \$2.75, \$3, and

\$3.25 a day. The manager denied that any agreements made had not been posted. Later, it appeared that the superintendent refused to receive a committee of employees who desired to discuss the alleged disregard of the concessions granted at the conference in the summer. Three employees had been discharged, the committee said in their letter, without an investigation or a hearing. On the superintendent's refusal, the strike was ordered. Nonunion men were employed to some extent, but many of them were induced by the strikers to give up their places. The employees of the Erie road refused to handle Lehigh valley freight. The strike prevented the moving of coal, and thus threw many miners out of work. Trains run by the new men were stoned on certain parts of the road, and there were some wrecks by obstructions on the tracks which were attributed to the strikers or their influence. But on the whole the strike was conducted in an orderly manner.

The strike came to an end about Dec. 6. Concessions were made by both sides, the men succeeded in establishing the right for which they were contending—that of laying grievances before the representatives of the company by committee. The company's estimate of the loss incurred by the strike was given in the superintendent's report as follows: Damage to locomotives, \$46,000; damage to cars, \$19,000; damage to freight in wrecks, \$9,450; damage to perishable freight by delay, \$2,550. While the report contains no estimates of the general loss of traffic and increase of expenses, an official said that the company estimated the loss from those sources at about \$500,000, and the total cost of the strike at about \$600,000. It is also stated in the report that the assumption that the strike grew out of a refusal on the part of the officials to discuss grievances with its employees or to carry out the rules adopted and posted Aug. 7 is a misapprehension of the facts, to correct which a number of documents are submitted. One of these is a circular addressed to the members of the Order of Railroad Telegraphers by Grand Chief Telegrapher Ramsay, under date of Nov. 23, five days after the beginning of the strike, which says: "The chief cause of the strike is the refusal of the Lehigh valley officials to recognize Brother J. L. Hughes in his capacity as a member of the protective board of the Order of Railroad Telegraphers. In other words, the company's officials refuse to recognize the representatives of organized labor, the very object for which organizations are formed; hence the strike."

The Homestead poisoning cases were tried in January, and resulted in some convictions. Testimony was given to show that croton oil and arsenic had been taken by one of the men that died. Evidence was given implicating two of the union men by two cooks who confessed their own complicity. All four were sentenced to the Penitentiary. In July the two who confessed made another confession, in which they said that they had sworn falsely, and that no poison was administered. The charges against the officers of the company and the Pinkerton detectives were dropped in June, and all the strikers who had been arrested but not tried were released on their own recognizance.

A feud between the Italians and the Hungarians employed in the mines at Harleigh and Milnesville culminated in a fierce fight, April 15, in which four men lost their lives and several others were wounded.

The State Grange.—This body held its twenty-first annual convention at Harrisburg, Dec. 12. The reports showed that 18 new granges were organized during the year, and 5,000 new members added. About 500 granges were represented. The whole number of granges is 650, the aggregate membership about 55,000. The legislative committee declared in its report against the construction put upon the Boyer act by the Department of Public Instruction and many county superintendents, who contend that the increased appropriation to the public schools is for the purpose of lengthening the school term and increasing the salaries of teachers. The committee contends that the Boyer act was intended to lessen the burdens of local taxation as set forth in its title, and not to increase the school term and salaries of teachers.

Members of the Legislature who voted against the Niles Tax bill and the measure changing the method of electing members of the State Board of Agriculture were censured.

Resolutions were adopted demanding that Secretary of Agriculture Morton retract the utterances against the grange, alliance, and other kindred agricultural organizations, made in his speech before the World's Fair Congress.

The Harmony Society.—A bill in equity was filed in February against the president and members of this society, praying for the appointment of a receiver to wind up its affairs, an injunction to restrain the officers from selling or assigning the property, an order to them to pay to the receiver the amount of losses sustained under their management, and an order for the dissolution of the society and division of its assets. It is alleged that recently the society had property valued at \$4,000,000, but that a great deal of this has been lost, and that the petitioners now believe that the society is insolvent; that within six years Duss, the president, has sold two million dollars' worth of valuable stocks, ostensibly for the payment of debts, which debts were contracted through his own fraud, neglect, and mismanagement. It is also alleged that the principles of the society have become obsolete; that Duss and Sieber, a trustee, are living in luxury with their wives, whereas the main principle of the organization is celibacy.

It is further charged that Duss has given away large sums of money to support one Cyrus Teed, *alias* "Koreh," who claims that he is God, and who is surrounded by certain deluded women whom he calls his "angels"; that Duss has heretofore purposed to introduce Teed and his associates into the Harmony Society, and as a preparation for this end has erected a large and expensive residence on the lands of the society at Economy for Teed and his associates, at a cost of \$12,000. The complainants also charge that Duss has preached the doctrines of Teed, and that he has courted sympathy with one Michael K. Mills, commonly known as "Prince Michael," of Detroit, another pretender of divine attributes, who is now serving a term of imprisonment for the commission of a crime.

The Field of Gettysburg.—A trolley electric road has been built at Gettysburg, running around the National Cemetery and in the Emmitsburg Road. The first trip was made July 18. During the progress of the work complaint was made that the blasting and grading for the road were changing important features of the historic battlefield, and investigation was made in June by a member of the Gettysburg Battlefield Commission, who reported to the Secretary of War. He said:

When I left Gettysburg, workmen were engaged in blasting out a group of bowlders, covering a space 75 by 25 feet, which formed a portion of the defenses in front of the left of the Third Army Corps during the second day's battle. A variation of a dozen feet in the line, which there was ample chance to make, would have cleared those bowlders; but it was evident that they were being blasted for material from which to make filling for the road, which is swampy at that point.

The bowlders which covered the combatants in the desperate engagement between the Fourth Maine and Fortieth New York of the Union army and the Forty-fourth Alabama and the right of Benning's brigade of the Confederate army are already blasted, and the fragments broken under the hammer are covered with earth to form a roadbed, and it is this locality which has been turned into a park, to which cheap excursions are to be run from Baltimore and other cities.

This is the most wild and picturesque section of the field. For the distance of over one mile before reaching this locality the road cuts ruthlessly through the scene of some of the most desperate encounters of the battle, in which De Trobriand's, Tilton's, Sweitzer's, Zook's, Kelley's, Cross's, and Ward's Union brigades, and Kershwell's, Semmes's, Woolford's, Anderson's, and Robertson's Confederate brigades contended for hours.

The damage already committed by the electric road is very great, and can never be repaired; but the present desecration is but the commencement of what may be done if this company is allowed to invade other sections of the battlefield.

Citizens of Gettysburg applied to the Attorney-General of the State for a writ of *quo warranto* to take away from the Gettysburg Electric Railway Company its charter and exact a forfeiture of its rights, and the case was argued before the Attorney-General in August.

Judicial Decisions.—The question came before the court whether the Legislature can appropriate money to pay an official not provided for by statute. In the general appropriation bill passed at the last session of the Legislature \$4,800 was appropriated for the payment of an additional clerk in the office of the prothonotary of the Supreme Court for the eastern and western districts, respectively. When the man who had been serving as one of these clerks asked the Auditor to draw his warrant for salary, the Auditor refused, on the ground that he had no authority to do so, since the office had not been created by statute. The judge decided in favor of the Auditor.

The Supreme Court upheld the authority of a Sunday law, enacted in 1784, in a recent case, in which the publisher of a Pittsburg Sunday paper was convicted of violating the law.

The Attorney-General having given a decision that the Insurance Commissioner is entitled to all the fees in his department, the predecessor of the present incumbent applied for the amount of

the fees turned into the treasury during his term of eight years, and received \$16,000.

A taxation case of importance was decided in November. The State officers contend that under the act of 1891 the capital stock of corporations must be appraised arbitrarily at such sum as would at 6 per cent. yield the amount of net earnings reported, although the appraisal reached in that way may be higher than the actual value of the stock. In a great many cases the Auditor-General has, upon that theory, increased the valuation of stock made by corporate officers. The court of Dauphin County decided that the Auditor-General could not do this.

Political.—A State Treasurer and a judge of the Supreme Court were to be elected Nov. 6.

The Republican Convention nominated, Aug. 30, for Treasurer, Samuel M. Jackson, and for Judge, D. Newlin Fell. The resolutions affirmed adherence to the Minneapolis platform; demanded repeal of the purchasing clause of the Sherman act; favored expansion of the circulating medium till it should amount to \$40 *per capita* of the population; approved the proposition to issue to national banks notes to the par value of the bonds deposited to secure their circulation; declared that the obligations of the Government should be discharged in money approved and current in all civilized nations, and to that end that a largely increased reserve of gold should be gradually accumulated and maintained; expressed the belief that the financial distress in the country was due to the conviction that an attack was to be made on the American system of protection, and protested against any amendments to the McKinley bill until it should have been fairly tested and judged by its practical operation; condemned the pension policy of the Government; and demanded strict immigration laws. It was resolved that representation in future State conventions shall be based upon the vote cast at the presidential or gubernatorial election immediately preceding, one delegate being allotted to each legislative district for every 2,000 Republican votes, and an additional delegate for a fraction exceeding 1,000 votes, each district to have at least 1 delegate. The Legislature was commended for setting apart from the revenues of the Commonwealth an additional \$1,000,000 to defray the cost of public schools, thus increasing the appropriation for that purpose to \$5,500,000 per annum.

The Democratic Convention met Sept. 19. The nominees were: For Justice of the Supreme Court, Samuel G. Thompson; for State Treasurer, Frank C. Osburn. New rules were adopted for the organization of the party in the State, to take effect April 1, 1894. They do not change the basis of representation, but they give to the State chairman and the State executive committee the selection of all the temporary officers of a State convention. The platform approved the national Administration; demanded the repeal of the purchasing clause of the Sherman act; denounced the declaration made by the Republican State Convention in favor of an expansion of the currency; favored a currency of gold and silver coin, Treasury and bank notes sufficient for the business needs of the country, insisting that it shall at all times be kept at a parity of value;

approved the action of the Government in regard to pensions; attributed the financial disturbances to the legislation of the Republican party, and demanded tariff reform; approved the administration of Gov. Pattison, and condemned the last State Legislature; recommended a non-partisan judiciary; and urged thorough Democratic organization.

The Prohibition party nominated H. T. Ames for Judge, and J. S. Kent for Treasurer.

The People's party also placed candidates in the field.

The Republicans elected their ticket by large pluralities. Their candidate for Treasurer had 442,248 votes to 307,102 for the Democratic candidate, and their candidate for Judge of the Supreme Court had a plurality of 133,581. The Prohibitionists cast a vote of 21,358 for State Treasurer, and the People's party 6,979. Compared with the vote cast for President in 1892, the Republican vote was reduced 75,763, and the Democratic vote 145,162.

In Philadelphia the Republicans carried the city and county elections, their county candidates averaging pluralities of 52,000.

A call was issued for a conference to be held at Pittsburg, March 16, by persons interested in the forming of a new political party. The conference met in Lafayette Hall, where the Republican party had its beginning, and an organization was effected. The platform recognizes God as the author of civil government, equal right for all, without respect to race, color, or sex; abolition or suppression of the drink traffic, and such other moral, economic, financial, and industrial reforms as are needed in this country. A committee on permanent organization was appointed, and an adjournment was taken to June 6, at Harrisburg.

The officers of the electoral college were not paid for their services this year, the Auditor and Treasurer taking the ground that there is nothing in the law authorizing such payment. Four years ago the electoral college cost the State \$989.47. This amount was divided between the electors and the officers of the college. The expenses under the new decision were estimated at less than \$200.

Legislative Session.—The Legislature was in session about five months, from Jan. 3 to June 1.

The Governor's message, in referring to the insurrection at Homestead, said that the sheriff did not try to subdue it, and the county ought to pay the cost, \$430,000. The message further called attention to the inequality of taxation between real estate and personal property; renewed the recommendation that a revenue law be framed by which the entire cost of the State government be paid by a tax on corporations and collateral inheritance, and that other taxes be returned to the counties to relieve the real estate therein; urged legislation against combines, especially the coal monopoly, and favored free school books and renewed attention to quarantine. In reference to the public printing, the Governor called attention to the long delays in bringing out public documents, the printed report of a department often not appearing till the manuscript for the succeeding one was in the hands of the printer. He said precedence

was given to private contracts over government printing. This called out an answer from the public printer in the form of a letter to the Governor, who sent it to the Legislature. The printer said his delays are due to delay on the part of officials in furnishing the copy of their reports, and to their failure to return proofs promptly.

The following were named for the office of United States Senator: Matthew S. Quay, George Ross, George W. Childs, John Dalzell, and John B. Robinson. Mr. Childs declined to allow the use of his name. The Republican caucus made M. S. Quay the Republican candidate by a vote of 146 to 18 for Mr. Dalzell and 1 for Mr. Gobin. George Ross was the Democratic nominee. On the vote the House stood: Quay, 132; Ross, 66; Dalzell, 1; Harrity, 1. The Senate gave Quay 83, Ross 14, and Mutchler 1.

Bills were passed to the number of 452, of which 371 became laws.

The ballot law was changed in some of its details, though not as radically as was proposed. Following are the changes: The ballot is decreased to half its present size. Only one set of ballots and sample ballots is necessary. The percentage for party nominations is reduced from 3 to 2. The time allowed for printing the ballots is increased. It is provided that the printing of the ballots for spring elections shall be done under the supervision of the county commissioners. Certificates of nominations for members of the House of Representatives shall be filed with the county commissioners instead of the Secretary of the Commonwealth. One mark in a circle at the top of a column of candidates shall be a vote for every one in that column. Where the circle is not marked a mark for every candidate voted for is required. A screen or door must be placed on the front of each booth, thereby better securing privacy. Greater thickness of paper for ballots is provided for, and the corner of the ballot folded over shall be printed black, so that the number can not be seen through the paper. In case a voter votes more persons than he is entitled to, the ballot shall not be entirely thrown out, but so much of the ballot as is properly marked shall be counted. The disability clause of the act of 1891 is unchanged, but a penal clause is provided for any one who falsely represents his disability.

Other acts provide that polling places shall be within the territorial limits of the election districts; that electors shall vote where they are domiciled; and prohibit political committees and candidates from paying expenses of naturalization papers for aliens.

Election days are made legal half holidays from twelve o'clock noon till midnight. Vacancies in election boards are to be filled at any time before an election by judges of the Court of Common Pleas.

The sum of \$25,000 was appropriated for the purchase of the ground where the Continental army was encamped at Valley Forge. A commission of 10 citizens is to negotiate the purchase and adopt plans for improvement, preservation, and maintenance of the ground as a public park.

In the interests of labor, an act was passed in

regard to factory inspection. It forbids the employment of children under thirteen, and of any minors for more than twelve hours a day or sixty hours a week, and prescribes regulations to insure safety of employees. Another law provides for ventilation of bituminous coal mines. To provide arbitration in cases of variance between capital and labor, it was enacted that when differences arise it shall be lawful for either party, or for both parties jointly, to make application to the Court of Common Pleas where in the service is to be performed about which the dispute has arisen to appoint and constitute a board of arbitration to consider, arrange, and settle all matters at variance between them. The persons so appointed shall not be connected with the interests of either party; they may send for persons, books, and papers, and enforce their presence, and their decision shall be final. It was made unlawful to employ Pinkertons in cases of labor troubles. The first Saturday in September, instead of the first Monday, was made Labor Day.

The legislation in regard to schools included a law granting free text-books, with an appropriation of \$500,000 annually for their purchase.

The re-equipment of the National Guard was provided for and a reorganization bill making some important changes was passed. A naval militia was also established.

The main bills affecting the agricultural interests were those creating the office of dairy and food commissioner and that prohibiting the use of oleomargarine in institutions receiving State aid.

Among other measures passed were these:

Authorizing the formation of co-operative banking associations.

Appropriating \$500,000 for a State library building, and \$125,000 for remodeling the Capitol.

Punishing dairy adulterations.

Creating a forestry commission.

Requiring the public records to be kept in the English language.

Making appropriation for the purchase of medals of honor.

A resolution was passed in the Senate directing the Judiciary Committee to inquire into the right by which the factory inspector was holding his office and drawing the salary, since his nomination by the Governor had been rejected by the Senate of 1891. His name was again sent to the Legislature of 1893. On the reception of the majority and minority reports of the committee, a resolution was passed declaring—

That the action of the Governor relative to the office of factory inspector, has been derogatory to the rights of the Senate as a co-ordinate branch of the Government, and has not been in accordance with the constitutional requirements relative to appointments which he is authorized by section 8, Article IV, of the Constitution to make.

An organization was formed early in the session among the members from the rural districts, irrespective of party, with the avowed object of promoting legislation favorable to the agricultural interests. The Pittsburg and Philadelphia members regarded the movement as a combination against them, but all such intention was denied.

PERSIA, an empire in central Asia. The Emperor, called officially the Shah-in-Shah, is Nasreldin, born July 18, 1831, who succeeded his father Muhammed in 1848. Muzafereidin, the heir presumptive, was born in 1853. The Grand Vizier is Ashghar Khan.

The revenue for 1889 was estimated at 55,369,516 krans (1 kran is worth 12 cents in gold at the present price of silver). Of this, 36,076,757 krans represent taxes paid in money, 10,100,068 krans taxes paid in kind, 8,000,000 krans customs receipts, and 1,191,776 krans other receipts. The budget of expenditure was 42,233,472 krans for ordinary purposes and 1,000,000 krans for the Shah's palace, leaving 8,000,000 krans to

Teheran, in expectation of the re-establishment of free transit through the Caucasus into Persia. The British have not been able to make much use of the Karun river, which they obtained leave to navigate through diplomacy, hoping that it would give them access to the markets of central Persia. When the trading firm of Lynch put steamboats on the river that could navigate the upper course, the Persians added artificial obstructions to the natural ones at Abbas.

The rich eastern province of Khorassan is accessible to Indian as well as to Russian trade. The finer grades of Indian black tea and Indian and English prints and muslin are in demand. The Russians have obtained a large share of

THE CITY OF KUSHAN, DESTROYED BY AN EARTHQUAKE.

cover the deficit of the preceding year and 4,136,054 krans surplus. The ordinary expenditures were 18,100,000 krans for the army and navy, 10,000,000 krans for pensions, 8,000,000 krans for the Shah's household, 3,233,472 krans for local expenses, including a subsidy of 600,000 krans for the Kajar tribe, 1,900,000 krans for worship and education, and 1,000,000 krans for foreign affairs. There is no public debt.

The annual value of the imports is about \$22,000,000, consisting largely of cloths, mostly cottons, besides which sugar, glass, paper, iron, copper, and tea are imported. The exports amount to about \$15,000,000, consisting of opium, pearls and pearl shells, tobacco, cotton, silk, carpets, skins, gums, cereals, legumes, wool, dates, rice, etc. Of the exports, 61.6 per cent. are food articles, 31.3 per cent. raw materials, and 7.1 per cent. manufactured articles. There are 4,155 miles of telegraph lines, with 6,450 miles of wire, but only 11 miles of railroad. This railroad, which was built in the environs of Teheran by a Belgian company, has been acquired and is being extended by Russians, who are also building a road for vehicles from the Caspian Sea to

the trade in piece goods, and take most of the cotton and wool and a large proportion of the other exports. The town of Kushan, in Khorassan, was destroyed by an earthquake on Nov. 17, 1893, and the fertile country of which it was the center, planted in vineyards and gardens, was inundated. By these calamities about 12,000 people lost their lives, and the property and means of subsistence of the rest of the population were taken away. The arched structures in the illustration are brick-kilns.

Earlier in the year there was great destitution at the opposite extremity of Persia in Shiraz, capital of the province of Fars. The people accused the authorities of forestalling grain, and broke out in the middle of May in a riotous demand for bread. The famishing people plundered the bazaars, and the soldiers who were sent to suppress the riots joined the rioters.

PERU, a republic in South America. The Senate has 40 and the Chamber of Deputies 80 members, elected indirectly for six years, one third retiring every two years. The President serves four years. Remigio Morales Bermudez is President for the term ending Aug. 10, 1894.

His Cabinet at the beginning of 1893 was composed as follows: President and Minister of the Interior, Police, and Public Works, C. M. Elias; Minister of Foreign Affairs, E. Larrabure y Unanue; Minister of Finance and Commerce, R. Quiroz; Minister of Justice and Worship, Dr. J. Puirredon; Minister of War and Marine, B. Morales Bermudez.

Area and Population.—The area of Peru is 437,000 square miles. The population is estimated at 2,980,000, including 350,000 uncivilized Indians. Lima, the capital, had 103,956 inhabitants in 1891. There are 18,000 Europeans and 50,000 Asiatics in the country.

Commerce.—The imports for 1891 were valued at 15,166,000 soles or dollars, of which 6,289,000 soles came from Great Britain, 2,865,000 soles from Germany, 1,576,000 soles from France, 1,323,000 soles from the United States, 1,103,000 soles from Chili, 539,000 soles from China, 468,000 soles from Belgium, 445,000 soles from Italy, and 558,000 soles from other countries. The total value of the exports was 12,371,000 soles, of which 5,811,000 soles went to Great Britain, 1,190,000 soles to Chili, 1,111,000 soles to Germany, 354,000 soles to France, 278,000 soles to the United States, and 3,627,000 soles to other countries. The values of the principal exports were: Sugar, 2,921,000 soles; silver in ingots and silver ore, 1,198,000 soles; cotton, 1,014,000 soles; wool, 887,000 soles; silver-bearing lead ore, 433,000 soles; rice, 150,000 soles; gold bars, 145,000 soles. The state railroads have a length of 760 miles and private railroads 125 miles. There are 1,415 miles of telegraphs.

The foreign commerce of Peru has fallen away, and business in 1893 was generally depressed and disorganized. When specie payments were restored in 1888 and an arrangement was made later with the foreign bondholders whereby the railroads could be operated properly and completed in the sections that were most needed, the prospects of trade and production seemed bright; but there has been nothing but disappointment, and in 1893 the approaching election of a President added the demoralizing effects of political agitation. Gen. Caceres, the most popular general in the war with Chili, who was elected President after the war in succession to Dr. Nicolas Pierola, was the official candidate, having placed Bermudez in the presidential chair in the expectation of returning to power in the succeeding term. This custom of employing the power and patronage of the Administration to perpetuate the personal rule which the provision making a President ineligible for the next term is intended to prevent is even less liked in Peru than in other Spanish-American republics. The former term of Caceres was considered successful at the time, though the results of his policy had been disappointing, but now his candidacy was exceedingly unpopular among the democratic masses, whose favorite was Pierola, formerly decried as a dictator, who was living in exile at Panama, having escaped from the prison where he was confined for a revolutionary attempt against the Government of Bermudez. Several other aspirants had their followers in the various political cliques. Caceres was accused of bringing back from Europe, where he was minister at Paris, a large quantity

of arms and of influencing the Government to adopt coercive measures. The policy of his former administration was denounced as the root of all the political and economic evils of the country. The mob in Lima wrecked the offices of the administration journals, and those opposed to the Government were suppressed by the police. Riotous demonstrations and assaults and assassinations were committed from political motives. Pierola, who was not permitted to enter Peru, conducted his canvass from one of the towns occupied by Chili.

At the end of February a new Cabinet was chosen by President Bermudez, as follows: Premier and Minister of Foreign Affairs, Gen. Velarde; Minister of War, Manuel Villavicencia; Minister of Foreign Affairs, Chacaltana; Minister of Justice, Zagarra; Minister of Finance, Salvador Caverro. The preaching of the clergy against the Freemasons led to riots in various places. At Mollendo, on March 25, the Masonic lodge was sacked and the American consular agent was wounded by a pistol-shot, while the police looked on with passive indifference. The American Government demanded an expression of regret and reparation. The subpretext of police was removed and reparation promised.

On May 11 the Velarde ministry was succeeded by another, composed as follows: Premier and Minister of Foreign Affairs, José Manano Jimenez; Minister of the Interior, Pedro José Zavala; Minister of Justice, Alfredo Gaston; Minister of War, Nicanor R. Somocurcio; Minister of Finance, Eugenio Marquezado. One ground of difference between the parties was the question of the provinces occupied by Chili. By the treaty of 1883 the people of Tacna and Arica would decide by a popular vote at the end of ten years whether they would continue under Chilean rule or return to Peru. But the Chilean Government demanded as a condition of the restitution of the nitrate fields that Peru should pay the war indemnity of \$10,000,000, and this was impossible in the bankrupt condition of the Peruvian treasury. Congress met to organize on July 13 and began its regular sessions two weeks later. In Congress the predominant party was the Union Civica, which was hostile to the Government and to Caceres, and looked with no favor on the candidacy of Pierola, but could not agree upon its own standard-bearer for the elections of April, 1894.

Upon the assembling of Congress Irigoyen, the director-general of finances, and Mendizabel, chief of the treasury, were suspended on charges of corruption in the collection of taxes. Other officials and adherents of Caceres were implicated in the frauds. In consequence of a vote of censure passed upon Minister Zavala for violating the liberty of the press he was forced to resign in the beginning of September, and the portfolio was taken by Gaston temporarily at first and definitely when the ministry was reconstituted on the resignation of Marquezado at the end of the month. Latorre Gonzales succeeded the latter as Minister of Finance and Pardo Figueroa became Minister of Justice. The Government was unable to pay the annuity of £80,000 sterling which it undertook to pay to the Peruvian corporation under the Grace contract, as the treasury was empty and salaries and other obligations were in

arrears. Before defaulting, the Government attempted to prove a breach of contract on the part of the corporation, and the courts imposed a fine of £5,000, which was not collected because the charges were frivolous. The Congress refused to authorize the Government to cancel the contract. It agreed to a proposition to increase excise duties 50 per cent., and passed a bill re-establishing the gold currency and prohibiting the importation of silver coins. The editors who had been prosecuted were allowed by act of Congress to print their newspapers again. Gen. Caceres was declared to be a traitor, and a bill was passed to deprive him of citizenship on the ground that he had granted to Ecuador a part of the Peruvian territory when he was President. A new boundary treaty with Ecuador was rejected. At the close of October the most serious rioting of the year took place. The followers of Caceres demanded the dissolution of Congress and an immediate election of a new President. The police countenanced the disturbances, but not the ministers, who threatened to resign if energy could not be shown in repressing disorder, and who prevailed upon the President to order out the military.

PHYSICS, PROGRESS OF, IN 1893.

Constitution of Matter. Ether and Matter.—Prof. O. Lodge (British Association) has continued his experiments to detect a possible drag exerted by matter on ether. He has been able to rotate two disks of tough steel a yard in diameter and an inch apart 8,000 times per minute without obtaining evidence of such drag. An oblate spheroid of wrought iron weighing a ton and magnetized by a current sent through a wire wound around it in a deep groove was also rotated without effect.

The Fourth State.—Lord Kelvin (London Royal Society, Nov. 24) has followed out the hypothesis that the phenomena of the Crookes cathode stream are caused by inelastic molecules whose energy, by impact on the tube, is spent entirely in heating the glass. Taking the mass of matter in 1 cubic centimetre as equal to 10^{-6} , and the velocity to be 100,000 centimetres per second, the final temperature is 375° —about that found experimentally. The pressure would be about 100 milligrammes per square centimetre—ample for the observed mechanical results. The assumed velocity is too small to affect the optical color test, and Kelvin concludes that there is no objection to the Crookes doctrine of a cathode stream.

Mechanics. Foundations of Dynamics.—An extended discussion on the fundamental axioms of dynamics has been carried on by Prof. O. Lodge, Prof. McGregor, of Nova Scotia, and others, chiefly in the "Philosophical Magazine" and "Nature," one of the subjects of discussion being an attempt by Lodge to restate the laws of motion in terms of energy. In one of his new laws he asserts the continued identity of every portion of energy. This he upholds ("Nature," Jan. 16) on the ground that energy, like matter, is always passed on continuously through space. Heavenside, in reply, instances gravity as an exception, but Lodge asserts that even if gravity be passed on instantaneously, as if by a thrust of an incompressible body, it is none the less passed continuously.

Potential.—F. W. Dyson (at the meeting of the London Royal Society, April 20), in discussing the potential of an anchor ring, finds that a rotating ring is stable for fluted and twisted disturbances, but unstable for long, beaded ones. This has an important bearing on certain astronomical theories.

Elasticity.—G. F. Becker ("American Journal of Science," November) finds that if Hooke's law were exactly true, sensible changes of pitch would occur during the subsidence of vibration in strongly excited bodies. He deduces the following formula, which is not open to this objection: $\ln(a^3h) = \frac{Q}{M}$, where a —ratio of shear due to the traction Q , h —ratio of linear dilatation, M —Young's modulus, and n —modulus of distortion.

Grinding and Polishing of Solids.—Lord Rayleigh (British Association), in experiments on the grinding and polishing of glass by emery, finds that the former process is not a scratching, as has been generally supposed, but a formation of isolated pits or depressions, and that the polishing then removes molecular layers till the level of the bottoms of these pits has been reached. The polishing was good when a thickness equal to $2\frac{1}{2}$ wave lengths of sodium light had been removed, and was perfect when 4 wave lengths had been taken.

Gravity.—Mascart (Paris Academy of Science, Jan. 30) details the results of observations made at Parc St. Maur Observatory for many years, which show variations in the intensity of gravity. The instrument used was a barometer tube in which the mercury was balanced by hydrogen confined in an adjoining vessel. Daily variations were observed, as well as sudden variations which he thinks must have been due to displacements in the mass of the earth. Some of these lasted fifteen to sixty minutes, and caused a difference in the level of the mercury of .05 millimetre. D'Abbadie (ibid., Feb. 6) asserts that observations on falling bodies begun in 1837 in Brazil have made the constancy of gravity doubtful. He proposes to call Mascart's instrument a brithometer (Greek *brithos*, weight). Bouquet de la Gorge (ibid., Feb. 20), of the Dépôt de la Marine, has made observations with a similar instrument that indicates the change of the moon's position by an alteration of level of 46 millimetres. A. Berget (ibid.), using a similar instrument, which he calls a hydrogen gravimeter, has observed the effect of a change of level of 1 metre in a lake 79 acres in extent, reading the slight alteration of level in his instrument by a method depending on the use of interference fringes. He deduces as the value of the gravitation constant 6.80×10^{-8} , and as the density of the earth 5.41 . Richarz and Krigar-Menzel have finished a series of observations on the density of the earth that have been carried on by them in the citadel of Spandau since 1887. By balancing two heavy masses at different vertical distances below the balance beam, and then changing their places, it is found that the difference between the values of g for a change in level of 2.26 metres is 6.523×10^{-4} . The value calculated from other data is 6.970×10^{-4} . The discrepancy is due perhaps to the presence of strata less dense than the average.

Liquids. Solution.—S. U. Pickering ("Philosophical Magazine," February) finds that the product of the molecular weight of a liquid by the square of the rate of diffusion is not constant, which shows that osmotic pressure in a solution is not due simply to gaseous impact of dissolved molecules, or else that perfection is not attainable in diffusion experiments. C. Dieterici (Wiedemann's "Annalen," October) has measured the vapor pressures of aqueous solutions by the movements of an aneroid box, the concentration varying from extreme dilution upward. The curves expressing his results are similar for all solutions, beginning at approximately the same angle, then falling steeply, and finally tending to become parallel to the axis of abscissas. Humburg ("Zeitschrift für physikalische Chemie," xii, 4) finds that the effect of electrolytic dissociation on the magnetic rotatory power of a solution is too small to be detected.

Osmosis.—Tamman ("Journal of the Chemical Society," December, 1892), with a view of testing the theory that precipitated membranes act as sieves, letting through water, but not the molecules of a dissolved substance, has experimented with 3 membranes, respectively of tannate of gelatin, zinc ferrocyanide, and copper ferrocyanide, and solutions of 17 acids and salts. He finds that the permeability is the same for all the membranes, and thinks that his results indicate the passage of the ions of the acids separately. The behavior of the salts, however, was anomalous.

Crystallization.—E. H. Amagat (Paris Academy of Sciences, Oct. 16), after melting ice by compression at a temperature below zero centigrade, caused the water to solidify in crystals by gradually lessening the pressure. This he calls crystallization by decompression.

Expansion and Compression.—E. H. Amagat (ibid., April 17) finds that with water kept at constant volume the pressure increases rapidly with the temperature. Thus, for unit volume, the coefficient increases fourfold between 10° and 100°, and the variation is probably more rapid between 0° and 10°. The same (ibid., Oct. 31) has investigated the compressibility of ether, alcohol, carbon disulphide, acetone, ethyl halides, and phosphorus chloride, and finds that the coefficient of compression always decreases regularly as the pressure increases. At 3,000 atmospheres that of water was reduced by nearly one half its ordinary value, and that of ether by two thirds. This diminution is greater the higher the temperature.

Density.—A. Hanal (Vienna "Berichte," quoted in "Nature," March 16) measures liquid density by the following simple method: Two glass tubes are joined by rubber tubing 30 by 1 centimetre. One, which has two marks 80 centimetres apart, is immersed up to the lower mark in the liquid to be measured, and the other tube is immersed totally in water. On pulling it out, the liquid in both tubes rises till that in the first tube reaches the higher mark. The height of the water column, on a suitable scale, then measures the density.

Capillarity.—Ramsay and Shields find a close analogy between the equation $pV = RT$, that holds good for gases, and a similar equation $\gamma s = \kappa \tau$, for the surface of a liquid, γ being the

surface tension, s the surface area, κ a constant, and τ the temperature measured downward from a point about 6° below the critical point. This relation was found experimentally to hold good for several liquids. T. Proctor Hall, of Clark University, Worcester, Mass. ("Philosophical Magazine," November), has exhaustively studied methods of measuring surface tension. He employs three. (1) The weight of a thin horizontal bar having its extremities bent at right angles so as to touch the liquid was taken when a film extended between the bent ends, and also without such film. (2) With liquids where the film breaks before it is high enough (5 to 10 mm.) to give good results, a set of thin parallel vertical plates in a holder were weighed similarly. (3) With the bar used in the first method, the maximum of weight was taken just before the formation of a true film. This last method was found capable of almost incredible delicacy. Water showed great variations of tension, the averages running from 71.91 with glass to 73.29 with zinc—a smaller result than that obtained by Rayleigh from ripples. De Vries (Royal Academy of Sciences, Amsterdam, Feb. 25) has measured the variation of ascension of ether in capillary tubes from -102° C. to 193° C. The surface work, plotted as a function of the temperature, gives a curve with its convex side toward the axis of temperature and ending tangent to it. C. Maitezos (Paris Academy of Science, Nov. 14) finds that when a liquid spreads over the free surface of a denser liquid, microglobules are formed by inverting the liquids. If, on the contrary, a liquid rests in drops on a denser, in the inverted position the denser will spread over the less dense.

Viscosity.—Barus ("American Journal of Science," February) has found the influence of temperature, volume, and pressure on marine glue, and constructed curves showing his results. Among them are the striking preponderant influence of temperature on viscosity. He finds that in proportion as the viscosity increases with fall of temperature, its isothermal rate of increase with pressure also increases.

Hydrodynamics.—P. Rudski ("Philosophical Magazine," May) finds that there are two critical velocities for water in a straight pipe—a greater, making quiet motion impossible, and a smaller, making tumultuous motion impossible. When the liquid enters, the motion is tumultuous, but with a small velocity viscosity acts and the eddies die out. With increased velocity, however, the eddies break and reform. G. H. Bryan (ibid., April), in investigating the motion of a perforated solid in a liquid, finds that no forces act to maintain a screw motion whose axis is coincident with the central axis of the impulse.

Gases. Resistance to Motion.—Cailliet and Colardeau (Paris Academy of Science, July 17), using a receiver with a paddle wheel actuated by a weight, find that resistance offered to the motion of a plane is proportional to the surface, the square of the velocity, and the pressure and density of the gas. Two planes separated by a distance equal to the breadth of one met with only 1.1 time the resistance of one. Two planes 0.15 metre broad, even when one metre apart, did not meet twice the resistance of a single one.

Concentration of Energy.—G. J. Stoney ("Philosophical Magazine," April) remarks that if the universe is permanent, concentration of energy must go on somewhere to balance the dissipation of energy which we know to be continually taking place. He suggests that microbes may be its agents, as would be the case if they would assimilate only the swiftest of the moving molecules, thus continually sorting these out like the hypothetical "demons" of Clerk Maxwell.

Kinetic Theory.—Prof. L. Boltzmann (ibid., March), in discussing the equilibrium of *vis viva* in a gas, proves that the mean kinetic energies of a shell and an atom are equal, and Maxwell's law of the distribution of velocity between shells and atoms is thus satisfied without assuming impacts of shells and atoms on each other. If certain forms of central motion are suddenly disturbed by collisions, the same will be produced equally often elsewhere.

Heat. Thermometry.—E. H. Griffiths and J. M. Clark (Cambridge, England, Philosophical Society, Oct. 31), following the suggestion of Dewar and Fleming that the electrical resistance of a metal disappears at the absolute zero, find by extrapolation from the scale of a platinum thermometer that $R = 0$ at the mean value -273.86° . This agrees nearly with Joule and Thomson's thermodynamic value for absolute zero, which is -273.7° . They suggest that these data be used in the graduation of a class of thermometers.

Specific Heat.—W. Voigt (Wiedemann's "Annalen," No. 8), in a series of determinations of the physical constants of metals that have been subjected to the minimum possible amount of manipulation, finds that the specific heat of such metals especially differs from that of drawn and rolled metal.

Radiation.—B. Galitzin (ibid., 47, 1892) finds that the transfer of energy to new masses of ether is accompanied by expenditure of work in the case of reversible operations, and that in the case of adiabatic and reversible processes the amount of disposable energy is inversely proportional to the cube root of the volume throughout which this energy is distributed.

Mechanical Equivalent.—E. H. Griffiths (London Royal Society, Feb. 16) has endeavored to secure great accuracy in the determination of this constant by using a calorimeter that was practically suspended in the bulb of a huge thermometer, containing 70 pounds of mercury and showing a change of 1° centigrade by a rise of 300 millimetres. He finds that $J = 427.45$ kilogrammetres in the latitude of Greenwich.

Conductivity.—It has been generally supposed that freedom from convection currents in measuring the conductivity of liquids was insured by letting the flow of heat take place from above downward, but R. Wachsmuth (Wiedemann's "Annalen") shows that this is by no means the case, using a solution of blue iodide of starch, which is decolorized by heat. He observed in the liquid strata with wavy outlines, in some cases cooler at the top than at the bottom, and obtained evidences of vortex motion. It seemed impossible to avoid these movements in the liquid.

Temperatures of Vapor.—Sakurai ("Journal of the Chemical Society," June, 1892) has established the fact that the vapor from a boiling salt

solution has exactly the temperature of the solution, instead of that of the boiling point of pure water, as was formerly believed.

Sound. Photography of Sound Waves in Air.—C. Vernon Boys, in experiments having primarily for their object the photography of a moving rifle bullet, has obtained interesting records of the accompanying aerial waves. His apparatus, which was a triumph of delicate and ingenious construction, worked on the principle of making the bullet close an electric circuit in its flight, causing a spark to pass just as the bullet passed in front of the camera. The resulting photograph was really that of the bullet's shadow, being perfectly black. The air waves left their trace by refracting the transmitted light just at the crest where the variation of density was greatest. No waves at all appeared when the velocity of the bullet was less than the velocity of sound in air, and the inclination of the wave front to the vertical increased with the velocity of the bullet, both these facts being analogous to those observed when an object travels through water. See the illustration, which is a reproduction of one of Prof. Boys's photographs. Dr. Raps (Berlin Physical Society, Oct. 20) has gone further and photographed the vibrations in organ pipes, not directly, but by means of the displacement caused by the waves in a series of interference bands from an interference refractometer (see LIGHT, below). The results, as recorded on a moving sensitized surface, show sine curves corresponding to the fundamental when the pipe is sounded gently. When it is blown harder, harmonics appear superimposed on this, and finally the harmonics alone appear. Dr. Raps has also shown by this method the characteristic over-tones of each vowel as they appear when sung.

Vibrating Strings.—The experiments of Raps and Menzel ("Annual Cyclopædia," 1892, p. 637) have shown in their photographic records of the movements of strings that during part of the vibration the velocity of the strings is constant, while during another part they are practically at rest, the photographs showing zigzag lines with straight, flat portions at top and bottom.

Motion of Sound Waves.—C. V. Burton (London Physical Society, Feb. 24) shows that always in the case of plane waves, and in all practically possible conditions in spherical waves, the motion involves a surface of discontinuity. If the front of an air disturbance is produced by an impulse from a moving source, the wave front always moves faster than the source, even if the latter is moving faster than a feeble sound.

Light. Diffusion.—Chr. Wiener (Wiedemann's "Annalen," 12), in experiments on diffusion by rough surfaces, finds that Lambert's law that the brightness of the surface is independent of the angle is not strictly correct, the brightness at the edge of a rough surface being only six tenths that given by the law. At greatest brightness the angle of incidence exceeds that of reflection. W. E. Sumpter (London Physical Society, Dec. 9) thinks that the influence of diffusion in increasing the illumination of rooms and open spaces has not been sufficiently appreciated. In general, the light from the walls is much more important than that received directly, being in some cases twice as great. Ex-

periments on the percentage of light reflected by various diffusing surfaces resulted as follow :

MATERIAL.	Per cent. of light reflected.
Blotting paper.....	82
Cartridge paper.....	80

and 1.2058. Olszewski and Witkowski (Cracow Academy, quoted in "Nature," April 27) have determined the refractive index of liquid oxygen by immersing in it a double glass plate inclosing a layer of air, turning it, and measuring the bright interference fringes at the borders of the field of total reflection. They find the relative index to be 1.2282 and the absolute index 1.2285. In the same experiments they ascertained that the maximum absorption of the liquid is between $\lambda = 577$ and $\lambda = 570$ where it is 84 to 89 per cent. for a thickness of one millimetre. P. Joubin (Paris Academy of Science, Dec. 13) thinks that he has established the law

PHOTOGRAPH OF RIFLE BULLET IN MOTION, WITH ACCOMPANYING SOUND WAVES.

The long object at the left is the bullet, moving from right to left. The irregular thick black lines just in front of it and some distance behind it are the wires between which it has just closed the electric circuit that caused the spark that took the picture. The waves are seen stretching diagonally back from the front and rear ends of the bullet. Each consists of a dark line with a light line within it, showing that both waves are waves of compression. The horizontal line near the bottom of the photograph and the V-shaped one at the top are reflectors. It will be seen that the waves are reflected like all similar disturbances, and that in the reflected wave the position of the dark and light lines is reversed, the wave of compression being reflected as a wave of rarefaction.

Refraction.—Kayser and Runge (Berlin Academy of Science) have measured the refractive indexes of the atmosphere for every part of the spectrum by the deflection caused by a prism introduced between a Rowland grating and a sensitive plate. For the normal temperature and pressure the indexes are as follow:

A. 1.0002909	F. 1.0002870	H. 1.0002975
D. 1.0002819	G. 1.0002909	N. 1.0002800
		256 μ , 1.0002917

Living and Dewar ("Philosophical Magazine," October) find that the refractive indexes of liquid nitrogen and liquid air are respectively 1.226

that the index of refraction is proportional to the square root of the quotient of the molecular weight by the number of constituent atoms.

Dispersion.—Rubens and Snow ("Philosophical Magazine," January) find that the dispersion of fluorite is exceedingly small in the visible spectrum and very great in the infra-red, so that it is peculiarly adapted to the production of heat spectra. It is, moreover, easily worked, and has a very permanent surface.

Absorption.—G. B. Rizzo (Turin Academy) has measured the absorption of light by platinum at different temperatures, a transparent

film of the metal being incased in nitrogen to avoid oxidation. He found that as the temperature increased the transparency also increased, so that since electrical resistance also increases with temperature, transparency and resistance increase together, as is required by the electromagnetic theory of light, which thus receives additional confirmation.

Color.—Capt. W. de W. Abney (London Royal Society, June 1), in a comparison of natural colors with pigments, finds that the blue of the sky is about wave length 4,800, and that of artists' cobalt about 4,812, so that painters in this case have chosen the proper pigment with remarkable exactitude.

Effect of Light on Pigments.—W. S. Simpson, acting on the report of a commission which in 1888 reported that water colors fade only when in contact with air, has devised an air-tight frame in which such pictures may be kept fresh indefinitely. An attached manometer enables a leak to be detected at once.

Actinometry.—H. Rigolot ("Journal de Physique," November, 1892) has constructed a chemical actinometer of two plates of oxidized copper in water containing one part in a thousand of a haloid salt of sodium. One plate is exposed to light, and the resulting photoelectric current is measured. On investigating the effects on this instrument of different parts of the spectrum, the inventor finds that it agrees with the eye in being most sensitive to red, not to violet, as are the salts used in photography.

Polarization.—Rubens and Du Bois (Berlin Physical Society, June 2) find that heat rays of long wave length are polarized by a grating of metallic wire, just as electro-magnetic radiation is. Such a grating will not polarize light, but the result shows that this is only because of the short wave length of the luminous radiation. The results show also that in the ultra-red waves, as in electro-magnetic waves, the vibrations are at right angles to the plane of polarization. The measurements were made with the bolometer. Emil Hirsch (Wiedemann's "Annalen," No. 3), in experiments on the circular ferro-magnetic polarization of transparent films of iron, nickel, and cobalt, finds that Kundt's constant (the ratio of the rotation of polarization to the increase of magnetization potential from one side to the other) is independent of the temperature.

Diffraction.—Gouy (Paris Academy of Science, Nov. 6) has succeeded in obtaining the image of an opaque object by diffracted light alone by intercepting the geometrical rays by a screen near the focus of the object glass. The diffracted rays form an outline of the object traced in a thin bright double line separated by a black interval due to the interference of the rays within the shadow with those without it.

Photometry.—Charles Henry (Paris Academy of Science, Jan. 16), in further tests of his phosphorescent zinc-sulphide photometer (see "Annual Cyclopædia," 1892, p. 640), finds that the sulphide emits at any given moment light whose intensity is independent of the intensity and duration of the primary illumination, and of the thickness of the layer, and not varying with the sample examined, thus fulfilling all requisites of a good photometric standard. Prof. A. M. May-

er, of Hoboken ("Philosophical Magazine," August), uses a rotating disk with translucent sectors for the photometric comparison of two lights of different tints on opposite sides of the disk. The result is to produce a nearly white light, which is made to appear quite white by the use of contrast colors. Lights of different tints, as lamplight and daylight, can thus be compared with good results. To the same end Prof. O. N. Rood ("American Journal of Science," September) has devised a photometric method, independent of color, that depends on the shock experienced by the retina when one surface is withdrawn and replaced by another. The two surfaces whose luminosities are to be compared are arranged as halves of a disk. When this is rotated a flickering sensation is perceived unless the luminosities are the same, and this sensation is entirely independent of color. A. P. Trotter ("Philosophical Magazine," July) has devised an improved photometer, using the principle of two screens set at such an angle, or in such a way, that each receives light from one and only one of the sources to be compared, while the observer can see both at once. He employs a plain screen and one in which there are numerous slots, through which the first can be seen. Slots are preferred to holes on account of their symmetry. The best material has been found to be zinc. S. P. Thompson (*ibid.*) discusses what he calls the vibration principle in photometry—namely, that a more exact measurement can be made when the intensity of one of the compared lights is made alternately greater and less than that of the other. To this end (1) one of the screens may be vibrated, (2) one of the lights may be vibrated, or (3) one of the lights may be caused to vary in intensity. The author puts the principle in practice by mounting the paraffin block of a Jolly photometer on a spring.

Spectroscopy.—J. R. Rydberg ("Philosophical Magazine," March) finds that the focal curve that passes through the center of curvature of a Rowland's grating is a circle, but has not the radius of curvature at the apex of the grating as a diameter. It is possible to make the proper adjustments, but the girder on which the telescope moves must be a diameter of the true focal circle. The fact discovered may result from the noncoincidence of the point of symmetry of the grating with the apex of the mirror, or from a systematic variation in the distances between the lines, due to an irregularity in the screw of the dividing engine. Prof. Rowland (*ibid.*, May) has himself investigated irregularities or "ghosts" in his gratings. The effect of small errors of ruling, he finds, is to produce a diffused light around the spectral lines. This is subtracted from the light of the primary line, and its comparative amount varies as the square of the relative error of the ruling and the square of the order of the spectrum. Thus, a periodic error diminishes the intensity of a line, and surrounds it with a symmetrical system of lines called "ghosts," which are found most troublesome in spectrum photography. A periodic displacement of one millionth of an inch in the ruling produces visible ghosts, and sometimes the primary line is replaced by them altogether, but from a formula a table of the ghosts of

any particular grating can be made, so that they need not prevent accurate observation. Crova (Paris Academy of Science, March 27) has investigated the spectra produced by a grating of bichromated gelatin on silvered glass. The interference of the spectrum from the gelatin with that from its reflection in the glass produced straight or curved bands, sometimes of great beauty. No such bands were observed with transparent glass, since its refractive index is the same as that of the gelatin. W. B. Croft (London Physical Society, Dec. 9) has investigated the orders of colors in the so-called Newton's scale. The standard treatises imply that the number of bands in each order is the same as that of the order, but Mr. Croft finds that the first three orders have one band each, and the fourth three bands. The explanation is based on the numerical position of the wave lengths in the visible spectrum—that is, on the answer to the question whether a multiple of one wave length can be a multiple of another. B. W. Snow (Wiedemann's "Annalen," No. 10) has investigated infra-red spectra, using a modified bolometer and a galvanometer with a delicate quartz fiber. In the solar spectrum he finds numerous bands composed of fine lines, as far as wave length 20,620, the principal ones being between 7,000 and 7,700, 7,850 and 8,600, 9,000 and 10,000, 10,750 and 11,600, 13,700 and 15,000. The infra-red spectra of 5 metals—sodium, potassium, lithium, rubidium, and cesium—were examined, and maxima found as follow: For sodium, at 8,180, 11,270, 12,400, and 18,360; for potassium, at 7,870, 10,820, 11,580, 12,250, and 14,610; for lithium, at 8,070; for rubidium, at 7,910, 9,980, 13,120, and 14,760; and for cesium, at 8,380, 8,820, 9,980, 13,270, and 14,530.

Interference Refractometer.—This instrument, so named from its first uses, and called also by Michelson in one form a wave compiler ("Annual Cyclopædia," 1892, p. 639), promises to become one of the most valuable physical instruments. In a description ("Nature," Nov. 16) Prof. Michelson asserts that for certain purposes of measurement it surpasses and will supersede the telescope, the microscope, and the spectroscope. This is due to the fact that the limit of accuracy in setting a cross hair of a microscope on a fine-ruled line is about .05 micron, whereas the middle of an interference fringe, if it be broad and clear, can be determined to within $\frac{1}{10}$ of the width of the fringe, or .01 micron. In actual practice it has been found that the average error is only about .01 of a fringe, or .003 micron. Thus, what is lost in distinctness is more than made up in accuracy in measurements of position. Similar considerations hold in the measurement of angles by the telescope. As a spectrometer, for which the form called a wave compiler is used, the instrument possesses no advantages over the ordinary spectroscope in clearness of definition; its great advantage lies in the ease with which the distribution of light can be inferred in a spectrum beyond the powers of either instrument to resolve perfectly. Not the least of the uses of the instrument is the comparison of material standards of length with that of a light wave, thus furnishing a permanent metrical standard, the same for all parts of the known universe.

Electricity. The Voltaic Cell.—Elster and Geitel, of Wolfenbüttel ("Zeitschrift für physikalische und chemische Unterricht," quoted in "Nature," Jan. 5), have devised an apparatus for measuring the difference of potential of a cell, based on the principle of Thomson's water-drop influence machine. Two jets enter 2 insulated metal vessels through 2 rings, one of them connected with the positive pole of the cell. The jet is charged negatively, and communicates its charge to the vessel and by induction to the other ring which induces on the other jet a positive charge that accumulates on the second vessel.

Polarization of Cell.—Bouty (Société Française de Physique) has experimented on polarization in melted electrolytes, dilute solutions of salts, and solid electrolytes. When a point electrode remains in a melted electrolyte for twenty-four hours it has for a given time a constant initial capacity of polarization which increases rapidly with the time, while the maximum polarization decreases. John Daniell ("Nature," Sept. 28) finds that when thin partitions of metal are immersed in a cell polarization takes place when the thickness of the partition exceeds a certain definite amount. With a current strength of not more than 0.1 ampère per square centimetre this thickness is between 0.00009 and 0.0004 millimetre for gold, and between 0.00015 and 0.0002 for platinum in sulphuric acid, copper sulphate, and common salt.

Resistance.—Fernando Sanford, of Leland Stanford University ("Philosophical Magazine," January), shows that the resistance of a metallic conductor varies with the dielectric in the field of force, but that probably only that part in direct contact with the wire is concerned in the action. The resistance of a copper wire in air being taken as unity, the resistance of the same in various dielectrics was as follows: Petroleum, 1.0018; bisulphide of carbon, 1.0009; benzene, 0.9998; absolute alcohol, 0.9981; wood alcohol and petroleum, 0.9973. J. H. Gray and J. B. Henderson (London Royal Society, March 2) have investigated the effect of stress on the electrical resistances of copper, iron, and steel, and conclude that for practical purposes they are not affected thereby. The smallest impurity produces a greater change in resistance than the severest treatment, an impurity of 0.4 per cent., for instance, lowering the conductivity by 13.5 per cent. As the result of experiments made at the Physikalisch-Technische Reichsanstalt, Berlin ("Nature," Jan. 5), a mercury standard resistance has been constructed that requires no renewal. V-tubes are filled with mercury *in vacuo*, sealed by fusion, and into each end are fused three platinum wires, connecting respectively with the main circuit, the secondary circuit, and the galvanometer. The wire is so thin that it conducts practically no heat. Each standard is immersed in petroleum in a brass box, and the box is placed in ice and water. Van Aubel ("Journal de Physique," September), in experiments on the resistance of bismuth, finds that neither sudden cooling nor compression affects it much. When the metal is pure, the resistance increases with rise of temperature, and this increase is regular between 0° and 100°, but a trace of impurity alters the property.

Thermo-electricity.—Henri Bagard, of Nancy (Paris Academy of Science, Jan. 2), has measured the thermo-electric force between parts of the same electrolyte in different stages of dilution, the parts being separated by a diaphragm of goldbeater's skin. With a 5-per-cent. solution and one of 45 per cent. the difference of potential varied from 78 at a temperature of 17.9° to 155 at 73.5°, the unit being 0.0001 of a Daniell cell. Three couples respectively of 5 and 25 per cent., 25 and 45, and 45 and 5 gave no deflection, showing that the law of intermediate bodies is fulfilled.

Alternating Currents and Discharges.—John Trowbridge ("American Journal of Science," September) has photographed the discharge of a current having 300 to 400 alternations per second, using a rotating mirror. The interval between the oscillations of the discharge was 0.00001 second. On each photograph 10 to 12 oscillations could be counted; after that there was a brush discharge. On intercalating a non-inductive water resistance and a vacuum tube, effects similar to those of the aurora were observed (see below). A. A. C. Swinton ("Philosophical Magazine," September) attached to one electrode of an alternating circuit of high frequency and potential a flat tin dish containing a half-inch layer of resin oil, and to the other a wire with its extremity 3 or 4 inches above the oil. The oil bubbled and foamed violently and crept up the sides of the dish, probably from the repulsion of air particles. Water did not act in this way, but showed an octopuslike branched spark. I. Pupin (ibid., April) obtains an alternating current of constant and easily determined frequency by means of a transformer whose principal circuit has for an interrupter a vibrating wire stretched between the pole pieces of two permanent horseshoe magnets, and having at its center a short wire dipping in a mercury cup. The tension is altered till its note is in unison with that of a fork of known pitch.

Brush Discharge.—Harvey and Hirsch ("Philosophical Magazine," July) find that in air and in oxygen positive electricity passes in brush discharge from a point to a neighboring conductor more readily than negative, while in hydrogen the opposite is true.

Electro-magnetic Radiation and Oscillation.—Augusto Righi (Academy of the Lincei) finds that ebonite, paraffin, and rock salt are perfectly transparent to electro-magnetic waves. Mica 1.7 millimetre thick absorbs 10 per cent.; glass 8 millimetres thick, 37 per cent.; and quartz (normal to the axis) 8 millimetres thick, 40 per cent. Reflection from paraffin indicated that the plane of polarization was at right angles to that of the electric force; from metal, that it was parallel. The refractive index of a paraffin prism was found to be 1.4. Bjerknes (Wiedemann's "Annalen," No. 9, 1892) finds that different metals have different absorptive powers for electric waves, increasing with electric resistance and magnetization. Iron and nickel show a marked damping effect. Sarasin and De la Rive ("Archives des Sciences Physiques et Naturelles") find that a circular resonator has a constant wave length to which it responds whatever be the dimensions of the oscillation; the strength of the induced spark only varies, attaining a

maximum for a certain length of oscillation. One half the wave length of such a resonator is equal to twice its diameter. They find also that in normal reflection from a metal mirror the first node is exactly on the surface. T. H. Blakesley ("Philosophical Magazine," May) shows that the ordinary equations of the discharge of a Leyden jar do not account for radiation, the assumption being that all the energy is expended in heating the circuit. He finds that the work is divided between the circuit and the field in the ratio $R : \lambda$, where R is the resistance and λ a quantity (constant or variable) depending, among other things, on the frequency. Thus, as the frequency increases, more and more energy is expended in the field. Janet ("Journal de Physique," August) finds that in a condenser with solid dielectrics, under the influence of rapid electric oscillation there is a lagging of the charges behind the differences of potential, or, in other words, for equal differences of potential the charges are smaller with increasing than with decreasing potential. R. Colson (Paris Academy of Science, Nov. 14) has experimented with a Ruhmkorff coil vibrating 130 times a second, with one terminal of which was connected a copper wire ending in a hook to which was suspended a linen thread 8 metres long, soaked in copper chloride, the lower end hanging free. A telephone connected with the thread ceased to give any sound at certain points. When both ends of the thread were put in connection with the terminal by fine copper wires two nodes appeared. When the thread was shortened these coalesced, forming a zone of extinction, which spread over the copper wires as the thread approached zero. This was apparently due to the interference of two waves meeting from opposite directions. G. H. Barton (British Association) finds that electro-magnetic waves in wires can be made to exhibit phenomena analogous to those of Newton's rings. Ludwig Boltzmann (Wiedemann's "Annalen," No. 1) removes an apparent contradiction between Maxwell's theory and Hertz's observations that even excessively thin metal plates do not transmit waves a few decimetres long, by showing that this is due to limiting conditions at the surface, which are deducible from Maxwell's formulæ. Patterson and Arnold ("American Journal of Science," November) call attention to a common ambiguity in stating the frequency of an alternating current, consisting in confusing the frequency of impulse with the frequency of oscillation. The latter depends on self-induction and capacity, and while the number of impulses per second is the same as in the primary coil, the number of oscillations may be greater or less. Nikola Tesla, in a lecture (Franklin Institute, Feb. 24) states that single-wire transmission is now practicable for a high electro-motive force and great frequency. Transmission without wires was also discussed, and, among the conditions, the possibility of ascertaining the earth's capacity. This could be done, the lecturer said, if we could find the period of oscillation of the earth's charge. If the earth were perfectly insulated its capacity would probably be less than a farad.

The Hall Effect.—Basset ("Nature," May 11), in a review of recent work, says that there seems

to be a fair amount of evidence that the Hall effect is intimately connected with the action of a magnetic field on light, though further evidence is required before it can be asserted that both are due to the same ultimate cause. He suggests as a desirable line of experiment the investigation of the effect of an electrified conductor on light reflected from it. Kundt (Berlin Physical Society, March 10), employing transparent films of iron, nickel, and cobalt, magnetized to 28,000 units, finds that the Hall effect increases with the rotatory power, and therefore with the magnetization. E. Lommel (Wiedemann's "Annalen," No. 12, 1892) remarks that iron filings on a plate arrange themselves along the lines of force, which are also equipotential lines, and therefore are at right angles to the lines of flow. If the plate is placed in a magnetic field these all change position, hence the Hall effect.

Discharge in a Gas.—J. J. Thomson ("Philosophical Magazine," October) remarks that the behavior of gas to the electric spark is analogous to that of a vapor condensing to liquid, to the freezing of a liquid, or to the deposition of crystals from a saturated solution. When a foreign substance, as water vapor, is present the potential difference supportable without discharge is approximately steady, but when the gas is carefully dried this difference becomes abnormally large. When the discharge once starts it falls to the normal at once, but if the gas is allowed to rest, still remaining dry, it rises again. These phenomena seem to point to the formation during a discharge of a modified form of the gas, perhaps by condensation of molecules to complex forms, which is hastened by nuclei, just as is the physical condensation of vapor to liquid.

Phenomena of Exhausted Tubes and Rarefied Gases.—Wiedemann and Ebert (Wiedemann's "Annalen," No. 9), discussing luminous phenomena in rarefied gases without electrodes, conclude that these are due to the displacement of tubes of electric force. Any metal plate, they say, in contact with a rarefied gas and exposed to slightly damped electric oscillations shows all the phenomena of a cathode. John Trowbridge ("American Journal of Science," September) concludes similarly that the aurora is due not to electric oscillations, but to the redistribution of lines of force produced by suitable earths. Leonard (Berlin Academy) caused the rays from an aluminum cathode to be projected on an aluminum window .003 millimetre thick, in a thicker plate. The rays passed through it and made the air faintly luminous with a bluish light, producing also a smell of ozone. Phosphorescent bodies glowed in the path of the transmitted beam as *in vacuo*. At a distance of 2.4 inches from the "window" it ceased to act thus, but its penetration varied for different gases. E. Goldstein (Berlin Physical Society, Dec. 16, 1892) finds that the anodic light of silver is brighter than that of aluminum. At the cathode the reverse is true. The effect is only seen in oxygen, and appears due to oxidation of the silver. Rimington and Wythe (London Physical Society, Nov. 25) find that when electrodeless tubes and bulbs are rotated in a constant electric field, a double fan-shaped image results, not symmetrical but displaced in the direction of rotation. This is a

direct transformation of mechanical energy into light. A. A. C. Swinton ("Philosophical Magazine," September) wound a vacuum tube with three turns of copper wire in a coarse spiral, one end of which was connected with a high-frequency induction coil, the other being free. Inside the tube appeared a blue spiral corresponding to the wire, but half a turn in advance of it. This he accounts for by the repulsion of the residual air within and consequent bombardment of the glass just opposite the wire. E. C. Rimington (London Physical Society, April 28) concludes that the luminous rings observed in exhausted bulbs and tubes when Leyden jars are discharged through coils around them are due rather to rapidly varying magnetic induction than to electrostatic action. When two loops are used so arranged that the electrostatic effects balance while the magnetic effects re-enforce each other, the luminous phenomena become brighter, while they disappear when the inverse arrangement is adopted.

Dielectrics.—G. Benischke (Vienna "Berichte," April 13) finds that the dielectric constant is independent of the strength of the electric field. He finds the constant to be: For paraffin, 1.89; for ebonite, 2.08; for sulphur, 2.42; and for glass, 4.17 to 4.52, the value for plate glass being 3.85. P. Janet (Paris Academy of Science, Feb. 20), in experiments on dielectric viscosity of mica, by comparison of the differences of potential and resulting charges during rapid oscillation, finds that the charges lag behind the corresponding potential differences analogously to Ewing's curves of magnetic hysteresis. Charles Borel (ibid., May 23) suspended a disk of paraffined paper by the center before a plate which was charged alternately positively and negatively at intervals of 0.006 second. When an earthed glass rod was held between and on one side, the disk rotated, owing apparently to the mutual action of residual charges. With a conductor or a good insulator there was a feeble rotation in the opposite direction.

Condenser.—P. Curie (Société Française de Physique) has constructed a very perfect condenser of two plates of silvered glass separated by three blocks of quartz. The center was separated from the guard only by a narrow line from which the silver was removed.

Electrolysis.—W. C. Dampier Whetham (London Royal Society, Nov. 24) has measured ionic velocities in electrolysis by the motion of the junction between two salt solutions of different density and different color when the current was passed across it. The following are his results, compared with values calculated by Kolbaum from the electrolytic conditions of solution, with Hittorf's values of the migration constant:

SOLUTIONS.	Observed.	Calculated.
AQUEOUS SOLUTIONS:		
Copper00026 .00079	.00081
Chlorine00057 .00079 .00045	.00058
Bichromates (group Cr_2O_7)00047 .00046	.000473
ALCOHOLIC SOLUTIONS:		
Cobalt chloride000049	.000060
Cobalt nitrate000079	.000079

Color of Ions.—Ostwald ("Journal of the Chemical Society," October, 1892), in experiments on the color of ions, finds that the spectra of dilute solutions of salts having the same colored ions are identical; for example, the permanganates give the same values for the absorption bands whatever the base.

Electric Heating.—Henri Moissan (Paris Acad.emy, May 29) has succeeded in distilling the most refractory substances by the heat of the voltaic arc. Quartz and zircon were fused almost instantly, boiled in a few moments, and finally vaporized; tungsten was cast in ingots. Again (ibid., June 12) 30 grammes of copper were volatilized in five minutes; silver distilled easily, condensing chiefly in globules varying from microscopic dimensions to the size of small shot, but partly in arborescent fragments. Platinum, aluminum, and tin were also distilled, the last condensing partly in a curious fibrous form. The distillation of gold is peculiarly interesting, the metal condensing in powder of beautiful purple sheen to the naked eye, but appearing under the microscope as minute spheres of the usual yellow color. On the cover of the furnace three annular deposits were found, of which the inner consisted of yellow globules of considerable size, the next of smaller ones, deep red, the outer of a purple sublimate. Carbon is first converted into graphite and then distills over, condensing in light semi-transparent brown plates, seeming to constitute a distinct allotropic variety. Even refractory alkaline earths, like magnesia and lime, have been distilled by this process. J. Violle (ibid., Dec. 26, 1892), from calorimetric measurements with part of the carbon detached from the hottest part during the passage of the current, finds the temperature of the voltaic arc (and therefore that of the volatilization of carbon) to be 3,500°. This remains constant, no matter what power is employed. Lagrange and Hoho (Bulletin of the Belgian Royal Society, No. 2) produce an arc by using a graphite electrode in sulphuric acid. A layer of gas forms around the electrode, and since nearly the whole resistance is concentrated here, the whole of the energy is transformed into heat there. The temperature depends only on the strength of the current. By this process the heating is not only intense but rapid. When one electrode is a bar of steel one centimetre thick (Paris Academy of Science, March 13), the other having a large surface, it was found on breaking the current that the liquid, cooling the bar, had imparted a brittle structure only to a superficial layer, the rest not having been heated. J. Klemencic (Vienna "Berichte," March 16) has investigated the heating effect of electric vibrations and concludes that the resistance to the passage of very rapid vibrations depends on the magnetizability and the kind of wire.

Photo-electricity.—E. Branly (Paris Academy of Science, April 20) finds that a disk of polished aluminum slowly loses its charge, and that this loss is equal for positive and negative charges and independent of the kind of light. If the disk has been freshly polished the loss is rapid even in diffused light, and is only slightly diminished by orange glass. From experiments on the effect of light on silver (Asiatic Society of Bengal, May), it appears that sunlight has an oxidizing effect on that metal, whether in acids

or in alkalies, and that the exposed plates become relatively positive.

Phenomena in Solutions.—G. H. Zahn (Wiedemann's "Annalen," No. 4) finds that when a current is passed across the boundary between two solutions of different degrees of concentration, there is an alkaline reaction above the boundary in the dilute solution, in case the current passes from the concentrated to the dilute, and a deposition of solid hydrates. The salts experimented with were those of barium, strontium, aluminum, iron, manganese, and zinc.

Magnetic Action of Induced Currents.—Elihu Thomson ("The Electrician") has discovered an apparent attraction of a copper disk by an alternating magnetic pole when the diameter of the disk is smaller than that of the pole. At some distance from the pole the disk is repelled, but the repulsion diminishes as it moves nearer, and finally gives place to attraction. The explanation is that the induced currents in the disk, on account of its small diameter, do not suffer so great a lag as those in the rings that surround the pole; hence the repulsion is finally overcome by the attraction between the currents in the disk and the iron core.

Piezo-electricity.—Dr. G. Gore ("Philosophical Magazine," February) finds that when a long vertical tube is filled with an electrolyte a current traverses it. When the tube is reversed the current reverses, and there is no current when the tube is horizontal. The effect varies with the liquid and with the metal employed for the electrodes, being greatest with zinc and potassium chloride. In 91 trials, 41 currents were obtained, of which 39 were upward and 2 downward. It was proved that difference of pressure without difference of altitude would give rise to a current, and that the effect was not due to thermoelectricity. In all cases the current results not only from a difference of electro-motive force, but primarily from the influence of pressure on the electric potential of the metal alone and the liquid alone. There seems to be a direct transformation of mechanical into electrical energy, and a discovery of its mechanism would doubtless be a solution of the whole question of electro-motive force. A. P. Chattock (ibid., December, 1892) thinks that the phenomena of pyro- and piezo-electricity are accompanied by relative motion of two sets of initially and oppositely charged molecules distributed throughout the crystal, and concludes that chemical affinity and ionic attraction are possibly the same. Kelvin (ibid., October) has constructed a piezo-electric pile of 24 double plates of zinc and copper resting at the corners on India rubber. When the poles are connected with a galvanometer and a weight is allowed to fall on the pile, a considerable deflection results. The author (ibid., November) suggests that a model of a crystalline molecule might be thus constructed.

Effect of Points.—Julius Precht (Wiedemann's "Annalen," No. 5) finds that points may be charged very highly, a lightning conductor taking 15,000 volts and the finest points 2,500. The ultraviolet rays favor such charge, but it is diminished by dust. A bundle of equal points requires a higher potential than a single one.

Magnetism. **Magnetization.**—H. Lehmann (Wiedemann's "Annalen," No. 3) has investi-

gated the magnetism of iron rings slit radially. The slit was 0.4 to 3.57 millimetres wide, and the strength of the magnetic field 1 to 300. He finds the demagnetizing factor constant up to about one half saturation, and the coefficient of dispersion—that is, the ratio of the mean induction to that at the slit—constant to the same point. The coefficient increased with the width of the slit, and finally decreased with increased intensity of the field, but was independent of the radius of the ring. The region of dispersion of force lines was limited essentially to the vicinity of the slit, and was narrower as the magnetization increased. G. M. Minchin ("Philosophical Magazine," August), in treating of the magnetic field of the electric current, states that its magnetizing effect is not the same at points near the surface of the conducting wire as if the whole current were concentrated in a thin filament at the center of the wire. Such an assumption is allowable only when the wire is straight or when it makes a curve of very large radius. Prof. Ewing and Miss Klaasen (London Royal Society, June 1), in experiments with Ewing's magnetic curve-tracer ("Annual Cyclopaedia," 1892, p. 642), find among other results that the time lag in soft, thick bars is immensely great. The work spent per cycle is a maximum at a particular frequency, which in such bars is very low. Heydweiller ("Sitzungsberichte der Würzburg Physical Society," March 11) proves the existence of a Villari point in nickel hitherto unknown. The magnetization used was very feeble, and the observing device very sensitive. The magnetization under 2 C. G. S. units shows a decrease with the smallest loads and an increase with the larger. The point seems to be between 765 and 246 grammes of load for $l = 0.97$.

Magnetism of Oxygen.—Dewar, in a Royal Institution lecture ("Nature," May 25), placed liquid oxygen in a cup of rock salt and drew it up with a magnet till the poles were connected by the liquid. Liquid air acted in like manner, but the oxygen and nitrogen were not separated by the action of the magnet. P. Curie (Société Française de Physique, April 21) finds that the magnetic permeability of oxygen is constant for forces varying between 200 and 1,350 units and pressures of 5 to 20 atmospheres. Between 20° and 450° it varies inversely as the absolute temperature.

Chemical Action in a Magnetic Field.—Lieut. G. O. Squier, U. S. A. ("Philosophical Magazine," June), finds that when iron is exposed to chemical action in a magnetic field there are two opposite effects: (1) A protective effect due to the direct influence of magnetism on the metal, and (2) the concentration of products of the reaction about the more strongly magnetized parts of the iron, tending to produce higher potential, and finally establishing permanent electric currents.

Diamagnetism.—P. Curie (Paris Academy of Science, Jan. 23) has measured the permeability of a series of diamagnetic bodies by inclosing them in an exhausted glass vessel exposed to a magnetic field and then repeating his experiment with the glass alone. Most of the bodies examined showed a constant coefficient, water and quartz not varying perceptibly with the temperature. That of potassium nitrate was the

same for the solid and the liquid form, but that of bismuth fell till the point of fusion (273° C.) was reached, when it suddenly dropped from .057 to .038, and then remained constant. Prof. Fitzgerald (London Physical Society, Oct. 28) says that diamagnetism corresponds to electrostatic induction, but that paramagnetism has no definite electric analogue, and is probably connected with an arrangement of material molecules, while diamagnetism depends on their electric charges.

Magneto-rotatory Phenomena.—Kundt (Berlin Physical Society, Feb. 10) has observed the change of magnetic rotatory power in metallic films with change of temperature. With nickel there was no change at first with rise of temperature, but above 800° there was a sudden diminution, which became greater as the temperature continued to rise, its relation to increase of temperature being the same as for the magnetic susceptibility of the metal.

Residual Magnetism.—Ewing ("Philosophical Magazine," October, 1892), in experiments on the influence of joints in reducing residual magnetism in iron, finds that the division of a ring 30 centimetres long into two half rings abutting against each other, with smooth joints, reduces it from 9,000 to 6,000.

Magnetic Viscosity.—Hopkinson, Wilson, and Lydall (London Royal Society, April 20) find that after a sudden change of the magnetizing force the induction sometimes does not attain its full value for several seconds, and that the difference between a ballistic curve of magnetization with complete cycles and a curve with considerable frequency is due to a true time effect.

Miscellany. Magnetic and Electric Instruments.—G. Quincke (Wiedemann's "Annalen," No. 1) has devised a novel form of instrument, which may be used either as a tangent galvanometer or as a magnetometer. A glass disk is supported vertically, and around the rim wires are clamped. In a hole in the center is a mirror with a magnet. This device has the advantage of great simplicity.

Dimensional Units.—Ostwald ("Journal of the Chemical Society," October, 1892) suggests the use of energy as a dimensional unit. The result would be in the direction of simplification, as the following table shows:

QUANTITIES.	Old dimensions.	New dimensions.
Energy.....	$m l^2 t^{-2}$	e
Mass.....	m	$e l^{-2} t^2$
Momentum.....	$m l t^{-1}$	$e l^{-1} t$
Force.....	$m l t^{-2}$	$e l^{-1}$
Surface tension.....	$m l^{-1} t^{-2}$	$e l^{-2}$
Pressure.....	$m l^{-1} t^{-2}$	$e l^{-2}$
Action.....	$m l^2 t^{-1}$	$e t$

Universal Reduction of Dimensions.—J. Delbœuf (Belgian Royal Academy, No. 6) discusses what would happen if the entire universe were reduced proportionately in dimensions. It has been urged that such a process would not be perceptible to us, since all our means of estimating size are only relative, and hence, for aught we know or ever can know, the universe may be expanding or contracting at any rate of speed. But M. Delbœuf shows that we would have several ways of detecting such a change. For instance, if the universe should shrink to half its

present linear dimensions, work done, being proportional to mass and the square of length (see table above), or (since mass is proportional to the cube of length) to l^3 would be reduced $\frac{1}{4}$, whereas muscular power being proportional only to mass, or to l^3 , would be reduced $\frac{1}{4}$. We could therefore lift four times as much weight as before. From similar considerations he shows that the velocity of sound would be changed, and that life altogether would become more rapid. In short, real space differs from geometrical space, and all its properties can not be increased or diminished at once in the same proportion. M. Delbœuf's critics, however, assert that he has not gone far enough. For instance, he has forgotten to take into account the molecule in his calculations. The distances between molecules must be affected by the assumed proportionate shrinkage; in other words, all bodies must be supposed to grow denser, and this would affect his results. It is claimed, therefore, that the outcome of this interesting discussion is to leave matters in the same status as they were before—that is, a state of ignorance on our part as to whether the universe is expanding, shrinking, or standing still.

Registering Instruments.—A. Blondel (Paris Academy of Science, April 10) generalizes all registering instruments by saying that all consist of a movable piece capable of displacement by a force proportional to the physical quantity to be measured, and opposed by a force proportional to the displacement, by the inertia of the moving parts, and by a damping force usually proportional to the velocity. The desideratum is that the periodic motion of the moving piece should follow a law as closely approximating that of the phenomenon as possible, so that the deflection shall at any instant depart as little as possible from a value equal to the ratio of the force to be measured and the opposing force. The problem of how best to attain this he calls the problem of integral synchronization.

PHYSIOLOGY. In his British Association address on biology last summer, Prof. Burdon Sanderson, after reviewing the early history of physiology, said that as a science it first became endowed with vitality by the labors of five great experimentalists—Brücke, Du Bois-Reymond, Helmholtz, and Ludwig in Germany, and Claude Bernard in France. By each and all of them it was recognized that, complex as the phenomena of life are, they may be to a large extent, if not wholly, referred to and explained by well-known chemical and physical processes, rendering it unnecessary to invoke any new force for their manifestation; and hence the analysis of a vital process into its physical and chemical constituents brings these constituents into measurable relation with physical or with chemical standards, which is the only mode of investigating them that can lead to satisfactory results. Thus, if muscular contraction be the subject on which we seek for information, it is obvious that, in order to measure its duration, the mechanical work it accomplishes, the heat wasted in doing it, the electro-motive force which it develops, and the changes of form associated with these phenomena, special modes of observation must be used for each of them, and each measurement must in the first instance be separately made under special conditions and

by methods specially adapted to the required purpose. Nor is this sufficient. The guidance of experiment must again be sought for the purpose of discriminating between apparent and real causes and of determining the order in which the phenomena occur. The speaker then discussed the question of the specific energies of the organism, or the special action which each part performs, illustrating it by examples drawn from the eye and visual perceptions. From this he passed to the subject of physiological or experimental psychology, a borderland between two methods of questioning that are closely related, the results of which tend to show that the processes concerned are as truly functions of organism as the contraction of a muscle or the changes produced in the retinal pigment by light. Although this branch has, in the opinion of Prof. Sanderson, no technical action, it has exercised, and will exercise in future, a helpful influence on the science of life. He next considered the influence of light in directing the movements of freely moving cells—called phototaxis—and similar phenomena in which the directing cause of movement is not physical but chemical, which are grouped under the general heading of chemiotaxis. This property was familiar in pathology as a constituent phenomenon of the process of inflammation long before it was understood. The hypothesis by which its explanation was attempted gave way to this as soon as it was made clear by Pfeffer. Only one principle—that of adaptation—separates biology from the exact sciences, and the author insisted "that organism is a fact which encounters the biologist at every step in his investigations; that in referring it to any general biological principle, such as adaptation, we are only referring it to itself, not explaining it; and that no explanation will be attainable until the conditions of its coming into existence can be subjected to experimental investigation so as to correlate them with processes in the nonliving world."

Respiration.—Is the high temperature in cases of febrile disease, asks Prof. Rosenthal, of Erlangen, the result of greater heat production? Are we to assume that certain poisons taken into the body or produced in it by microbes stimulate the nervous system, or directly influence the tissues in such a way as to cause greater oxidation, and thus to produce more heat? That is the opinion of many medical men, but it is met with the great difficulty that neither the expiration of carbonic acid nor the excretion of oxidized nitrogenous matter is increased in so great a degree as to account fully for the rise of temperature. Therefore Traube suggested that the rise of temperature in fever is caused not by greater heat production, but by greater retention of heat. Experiments by the author in producing fever in animals by the injection of various putrid substances gave results directly in accord with Traube's theory. Yet he can not say that heat production is never augmented in fever. There are great difficulties in the way of making satisfactory experiments on man. In a few cases—including one in intermittent fever, some in abdominal typhus, some in pneumonia, and some in cases of fever caused by the injection of Koch's tuberculin—he found a small but real augmentation of heat

production, and is therefore inclined to suppose that the question is not yet solved. On measuring the heat production of the same animal in cold and warm air, the author found it smallest in air of medium temperature, becoming greater in lower and in higher temperatures. In this case regulation of the animal temperature can be effected only by changes of the coefficient of emission of heat from the skin caused by changes of circulation. But for longer periods that regulation is insufficient. Animals produce more heat in winter than in summer. If nourished with the same food—sufficient to maintain their weight constant in winter—they do not oxidize the whole in summer, and therefore they gain in weight. Richly nourished animals produce less, sparsely nourished animals more heat than the calculation gives. Between the cases is a third one—in animals sufficiently nourished, or such as take in as much nutriment as serves to maintain their weight unchanged for a long time. In their case only, the amount of heat produced is really equal to that calculated upon the combustion of the constituents of food. But in these cases also variations are observed, caused by changes of temperature, muscular motion, etc. Thus, if a well-nourished animal is starved, the heat production remains unchanged for three or four days, the animal burning its stored-up materials and losing much of its weight; only then is it suddenly reduced to a lower amount. If now food is given again, heat production remains small, the weight increases, and then three or four days later the heat production increases and reaches its former amount. If a sufficiently nourished animal takes in all its food once a day the heat production varies very regularly in the twenty-four hours. Similar changes go on in the expiration of carbonic acid.

A committee of the British Association report on the physiological action of the inhalation of oxygen in asphyxia, that in the case of asphyxiated rabbits oxygen is of no greater service than air; that pure oxygen when inhaled by a healthy man for five minutes produces no effect on the respiration or pulse; that oxygen produces no effect upon a patient suffering from cardiac dyspnoea, either on respiration or on the pulse; that an animal can be kept for a long time in a chamber containing 50 per cent. of carbonic acid without a muscular collapse, provided a gentle stream of air or oxygen be allowed to play upon the nostrils.

Fishes in badly ventilated aquaria give various signs of oppression, such as restlessness, frequent gasping, mounting to the surface, leaping into the air, etc. Experiments have been made by Duncan and Hoppe-Seyler to ascertain to what point the oxygen content of the air may be lowered before fishes indicate uneasiness. They were made with tench, trout, and crawfish in an elliptical glass vessel, with pipes for injecting and removing water and air, etc. In one case a pipe communicating with a chamber in which was a live rabbit conveyed to the fishes air impoverished by the latter's breathing, while the behavior of rabbits and fishes in the same air could be compared. With from 4 to 8 cubic centimetres of oxygen in the litre of water the fishes seemed well and content, and with the corresponding oxygen tension in the

air (8 to 11 volume percentage) the rabbit was in no difficulty. With from 1.7 to 0.8 cubic centimetres of oxygen in the water the trout were evidently ill at ease, and if the condition continued they died. The tench and crawfish, however, stood still further reductions, the former finding relief at the surface. Reduction of the oxygen to zero soon produced the worst results.

Speaking in the Physiological Society of Berlin on heat regulation in man, Prof. Zuntz said that the store of heat in the human body is at any one time very large—equal, in fact, to nearly all the heat produced by the body during twenty hours; hence the heat given off to a calorimeter during a given period can not be taken as a measure of the heat production. This determination must be based rather upon the amount of oxygen consumed than of carbonic-acid gas given off. Experiments were made to ascertain what alteration the gaseous interchange of the body undergoes by the application of cold. The observations were made on a number of men whose respiratory gases were compared during rest, when they were at one time clothed, at another time naked, at different temperatures, and in warm and cold baths. Each experiment lasted from a half hour to an hour. The results exhibited great diversity, which was explained by the author's own subjective heat sensations when he was himself the person experimented on. After the first impression due to the application of cold was overcome, he found it easy to maintain himself in a passive condition; subsequently it required an effort of the will to refrain from shivering and throwing the muscles into activity, and finally even this became no longer possible, and involuntary shivering and muscular contraction supervened under fall of bodily temperature. During the first stage of cooling his oxygen consumption showed a uniform diminution; during the period also in which shivering was repressed by an effort of the will cooling led to no increased consumption of oxygen; but as soon as shivering became involuntary there was at once an increased using up of oxygen and excretion of carbonic acid. This may be taken as showing that in man, and presumably in all large animals, heat regulation as dependent upon alteration (fall) in temperature of the surrounding medium does not exist. The increased heat production is rather the outcome of the movements resulting from the application of cold to the body. In small animals there undoubtedly exists a heat regulation dependent upon an increased activity of chemical changes in the tissues set up by the application of cold to the surface of the body.

Circulation.—An investigation has been made by M. Potain to obtain the interpretation of the cardio-pulmonary sounds resulting from the movements communicated to the lung by the heart, and the local phenomena produced by these movements. The general movement, as indicated by the tracings, is during systole a rapid retreat of the surface and an equally rapid translation to the right; that is, in fact, the well-known torsional motion. At the end of the ventricle the retreat is only effected toward the end of the systole. At the beginning of diastole the whole wall rapidly collapses; it then rises, slowly at first, as the blood gradually

enters the ventricle, and then rapidly, when the systole of the auricle takes place. On comparing these trajectories with the sounds heard in man, and sometimes also in animals, it is found that their amplitude is greatest when these sounds are most intense and frequent, that their direction is that calculated to produce in the lung a rapid aspiration during systole, and that the rhythm of the sound is itself in correspondence with the variations of speed of the movement. The relation thus discovered solves a complex problem of auscultation.

In the study by C. S. Sherrington and S. Monckton Cope of the variations experimentally produced in the specific gravity of the blood, the method employed determined only the specific gravity of the blood considered as a mixed and complicated whole. What particular factor, or factors, in each case caused an alteration in the specific gravity remains to some extent a matter of conjecture. The alteration might be due to one, or two, or all, of the following causes: An increase or diminution in the number of corpuscles in a given volume, the specific gravity of individual corpuscles and of the plasma remaining unchanged; an increase or diminution in density of the plasma, the specific gravity and the number of the corpuscles remaining unaltered; or a simultaneous increase or diminution in density both of corpuscles and plasma, with or without alteration in the number of corpuscles in a given volume of the blood. When a quantity of normal saline solution is injected rapidly into the circulation, the specific gravity of the circulating blood is at once diminished, but the diminution persists for a short time only. It is attributed to the speedy escape from the circulation of the saline injected. Repeated injections of small quantities of saline solution into the vascular system do not perceptibly lower the specific gravity of the blood unless the interval of repetition be very small relatively to the amount injected. And even in the latter case no permanent dilution of the blood is brought about. By continued injection the blood of the rabbit may be kept for more than an hour at a degree of dilution nearly amounting to what would be reached by admixture with it of an equal volume of water, and this dilution is maintained without production of devious signs of circulatory, respiratory, or nervous distress. By observation of the alteration of specific gravity a means is obtained for gauging the volume of blood in the circulation of the animal receiving the injection. This volume in a well-fed adult rabbit, dog, or monkey appears to be somewhat less than 7 per cent. of the total weight of the body. The authors attempted to repeat the classical observation that during a period of prolonged fasting the blood shares but slightly in the wasting of bulk undergone by the tissues of the body as a whole. The conditions that influence the passage of water through living animal membrane are intimately dependent upon characters associated with the membrane considered as protoplasm, or material endowed with life. Toward the end of a long experiment it is extremely common to find that the specific gravity of the blood becomes lower, and when death occurs this diminution may amount to 2 or 3 units in the third place of decimals. The explanation of this is not clear, but

there are considerations that may throw light upon it, such as the appearance of local differences in specific gravity very soon after death and the clotting that rapidly sets in in the larger vessels. The slightest pressure on the splenic vein induces a rise in the specific gravity of the blood, the accompaniments of which are similar to the symptoms which surgeons associate with shock. A considerable quantity of water can be transferred from one part of the body to another, presumably by means of the circulation, without any obvious dilution of the blood. The effect of withdrawing any considerable quantity of blood from the circulation is to make the remaining blood poorer in solid matters. Notwithstanding the observations of Lloyd Jones and J. G. Otto, the authors have found the differences in the specific gravity of venous and arterial blood so slight as to leave the existence of an actual difference doubtful. That the important factor in the inspissation of blood in an area of obstructed venous flow is not the mere distention of the capillaries and venous radicles and veins, and the heightened pressure in them, seems indicated by the very different effect on the specific gravity which section of the cervical spinal cord occasions. Such section causes venous congestion of the great splanchnic region of the circulation. Yet so far from giving an increase in the specific gravity of the blood, it is an operation followed by a fall in the same. Local differences are observed in the specific gravity of the blood, and seem to be connected with differences in vasoconstriction.

The influence of great heights on the constitution of the blood has been studied by M. Viault and M. Muntz, whose conclusions are alike. The blood of rabbits taken from the plain to the top of the Pic du Midi and kept there for seven years had a respiratory capacity nearly double the normal (17 cubic centimetres to 9). The proportion of metallic iron was also raised from 40 per cent. to 70 per cent., indicating a corresponding augmentation in hæmoglobin. A long stay above is not necessary to produce these changes. Sheep in the Pyrenees, which are taken up the mountains every summer, show them in a few months. Even the mountains are not required, for M. Muntz has shown that the same result is brought about by increasing the proportion of combustible food consumed by the animal.

The researches of Dr. B. Levy on the circulation of the blood in the brain give results contradictory to those reached by Geigel, which were that constriction of the arteries produces an increased blood supply, and their dilatation causes the supply to decrease. Dr. Levy insists that physiological supply of blood to the brain is regulated in the same way as in all other organs—that is, that the dilatation of arteries produces an increase, and their constriction a decrease, in the current of the blood. Venous congestion leads to arterial anæmia. Acute compression of the brain—caused, for instance, by a foreign body penetrating the skull—and dilatation of arteries beyond certain limits, as by inflammation, have a like effect. Extensive depletion of the capillaries leads to a perversion of the blood supply. Dilatation of the arteries, then, produces anæmia, while contraction leads to hyperæmia. The supply is consequently not influ-

enced physiologically by the fact of the closure of the brain in a firm, unyielding case. The opening of the cranium likewise does not alter the supply.

The conditions under which the germicidal properties of the blood are at their highest have been investigated by Dr. von Fodor. The first series of researches had reference to the composition of the blood, and proved that arterial blood has a more destructive action on the bacteria than venous, and that fresh blood has a more powerful action than that which has been shed for some time. Again, the germicidal power of the blood was weakened in an atmosphere consisting entirely of oxygen or carbonic acid; on the other hand, the removal of gases from the blood had no appreciable influence. The blood of rabbits which had been poisoned by carbonic-acid gas was not fatal to the bacteria. No difference in effect was observed when the blood was kept in motion. The germicidal power of the blood increased with the temperature till it reached its maximum at from 38° to 40° C., and then gradually diminished. The individual predisposition of any animal to infectious disease seemed to stand in direct relationship with the germicidal power of its blood. A second series of researches was directed to determining the influence of drugs on the power of the blood to destroy germs. From them the author concluded that any drugs which caused increased alkalinity of the blood considerably raised the resisting power of the organism against the inroads of bacteria.

Respecting the detection of human blood, Dr. Copeman, of St. Thomas's Medical School, has remarked that, as there are no chemical tests for blood as such, the observer has to resort to the microscope for evidence of the presence or absence of the colored corpuscles. The tests applicable to the coloring matter are chemical, microscopic, and spectroscopic. The guaiacum test is readily applicable and trustworthy within certain limits, but is also given with milk, pus, and urine, and can not be accepted without corroboration. It is possible to mistake for blood a red stain—such, for example, as might be found on linen through a red scarf having been worn upon a part bathed with perspiration. This is the more likely to take place because sweat is occasionally charged with the coloring matter of the blood. Hæmin crystals may be obtained from a small stain by dissolving the coloring matter in glacial acetic acid, and, if the stain is an old one, adding a crystal of sodium chloride. No reliance for distinction can be placed upon the relative size of hæmin crystals obtained from human blood and those derived from the blood of other animals, for in both cases the size depends largely upon varying conditions. The size of the red corpuscles likewise does not furnish a reliable test. As yet the microscope enables us only to determine with certainty whether the blood is mammalian or not. The old *dictum* of the physiological text-books that the hæmoglobin of human blood can not be crystallized is contradicted. Dr. Copeman has obtained crystals of it in from ten to forty-eight hours. If arsenic is given to the patients for a few days the hæmoglobin ceases to crystallize, but begins to do so again when the arsenic treatment is discontinued. Human blood taken from the stomachs of leeches which have fed upon it will crystallize. The order of the appearance of

crystallization varies in different animals. It occurs more quickly in the blood of the rat, guinea pig, and squirrel than in that of the cat, dog, horse, and man. The micro-spectroscopic tests are important. Exposure to air turns hæmoglobin to meth-hæmoglobin, and it is the spectrum of this substance, which is peculiar, that is obtained from old blood stains. The best spectrum given by blood is yielded by reduced hæmatin. Monkey's blood crystallizes, so far as regards the oxidation of the hæmoglobin, exactly like man's—a fact which is not found to obtain in any other animal. But human hæmoglobin crystallizes rectangularly, while monkey's is diamond-shaped or six-sided. The blood of many domestic animals refuses to crystallize under the ordinary method for human blood, but may be made to crystallize by treatment with ether. The form of the crystals in all other animals than man differs from the rectangular prisms derived from human blood, and they always consist of oxyhæmoglobin, while in man and the monkey they are formed of reduced hæmoglobin. As a positive experiment, human blood may be made to crystallize by the addition of decomposing serum, by treatment with solution of bile salts, by agitation with ether, and by semidigestion in the stomach of the leech. Of these, the first is to be recommended as the best method.

Dr. Lilienfeld has observed Prof. Kossel's "histon" in the leucocytes of the blood, united to nuclein as "nucleo-histon." Histon prevents the clotting of blood, while nuclein promotes the formation of fibrin. These two facts are regarded as explaining the various phenomena connected with blood clotting. Thus the blood is fluid in the blood vessels because nucleo-histon is retained by the leucocytes. On the other hand, when the blood is shed, some of the leucocytes or platelets die, whereupon the nucleo-histon escapes into the plasma, is decomposed by the calcium salts there present into nuclein and histon, and the former (nuclein) then causes clotting. These facts also explain the action of calcium salts in promoting clotting.

Prof. Zuntz, having observed that strong muscular exertion has a different effect on the alkalinity of the blood in carnivora and herbivora, the point was reinvestigated in the author's laboratory by Dr. Cohnstein, who found that the blood of a dog at hard work on a treadmill showed no alteration of alkalinity. The result was unaffected by diet. During very prolonged exertion the blood was finally found to possess an increased alkalinity. Prof. Zuntz had found that the power of the blood of dogs to absorb carbonic dioxide was practically unaltered by exercise, whereas in rabbits it was considerably lessened.

In the case of an albuminous fluid discharged through fistulous openings by a patient troubled with a distention of lymphatics in the leg, Dr. J. Munk has found the discharge, though sometimes transparent, always milky after a meal containing fat. It thus resembles chyle rather than lymph, and probably really is chyle. At least two thirds of the fat given at any one meal reappeared in the fluid from the fistula. The time before the appearance varied according to the hardness of the fat, being longer with the harder fats. Large doses of starch or sugar hardly in-

creased the percentage of sugar, nor did large meals of albumen increase that of proteids in the fluid. Thus the only food stuff that leaves the intestine by the lacteals is fat.

Digestion.—While it is understood that the normal digestive processes going on in the living alimentary tract take place under different conditions from those which exist ordinarily in artificial digestion experiments, physiologists have been wont to assume that, so far as the purely chemical part of the process is concerned, the results are essentially the same. Minor differences, it is true, might be expected, as in the rate of action, which would presumably be more rapid in gastric digestion, where the products of the action are continually removed by absorption and fresh digestive juice is continually secreted, than in artificial methods, where the products necessarily accumulate and the digestive juice is limited to the original quantity. The main object of a recent study by Prof. R. H. Chittenden and G. L. Amerman was to ascertain by experiment how far the action of pepsin-hydrochloric acid on proteids is influenced by the partial removal of the products of digestion as they are formed, and whether or no, under such conditions, complete peptonization is possible. The results of a series of experiments for comparison of the proteolytic action of pepsin-hydrochloric acid in a flask with that in a dialyzer showed that the slow and incomplete peptonization, supposed to be characteristic of artificial gastric digestion, is not materially modified by this closer approach to the natural process, and favor the view that the conversion of the primary products of gastric digestion into true peptone is a slow and gradual process, even under the most favorable circumstances. The authors believe that complete peptonization is not a property of gastric digestion, either in the artificial or in the natural process; that the action of pepsin-hydrochloric acid is rather a preliminary stage in proteolytic digestion, a preparation for the more important changes peculiar to the small intestine, in which the more energetic alkaline-trypsin solution plays a conspicuous part. This view—that gastric digestion is a preliminary step preparatory to the more profound changes characteristic of pancreatic digestion—is confirmed by the experiments made as to the relative proportion of proteoses and peptone in natural gastric digestion in the human stomach, in which the two albumoses were found in considerable excess of the peptone. It is mentioned incidentally that the gradual diffusibility of the albumoses brought out by the authors' experiments, in which they were found to possess a certain power of osmosis, through vegetable parchment, although to a lesser degree than true peptone, may serve as a means for their partial utilization by absorption, without necessarily involving a complete conversion into the more diffusible peptone. Proto-gelatose was also found to be fairly diffusible, but with a somewhat lower endosmotic equivalent than the corresponding albumose.

In his experiments on the fat-splitting properties of pancreatic juice, B. K. Radford applied to the pancreatic juice of the rabbit a method based upon the spontaneous emulsion method of Gad. He found that the juice was alkaline, and remained so for some time after it was removed;

that if it was shaken with neutral olive oil, the oil rapidly took on an acid reaction, which was found to be due to fatty acid; that all the oil was split into fatty acid and glycerin by from one to two hours' action of the pancreatic juice; that the time required for the juice, acting in glass tubes at room temperature to develop sufficient fatty acid (54 per cent.) in neutral oil to give the maximum spontaneous emulsion, varied with different specimens of the juice and with the amount of shaking to which the juice and oil were subjected, the average in the author's experiments being twenty minutes; that the action of the pancreatic juice on most of the fats was rapid and complete; that while the pancreatic juice of the rabbit and neutral olive oil showed only a slight tendency to the formation of an emulsion by shaking the action was promoted by adding soda solution, but the emulsion did not remain good; that a permanent pancreatic emulsion may be formed by pipetting the oil from the surface of a tube containing oil and juice and shaking it with the carbonate-of-sodium solution. For this method great value and wide application are claimed by the author, as is seen in the study of the influence of bile and other agents on the fat-splitting action of pancreatic juice. Bile alone does not split fats. In the application of the present method, however, the addition of bile to the pancreatic juice greatly hastened its fat-splitting action. While hydrochloric acid retarded the action, bile and hydrochloric acid mixed hastened it; glycocholate of soda and a mixture of glycocholate of soda and hydrochloric acid hastened it; carbonate of sodium retarded it; the actions of these various substances being at different rates, which are calculated carefully by the author. The experiments having been planned with the idea of placing pancreatic juice under conditions as nearly as possible resembling those under which it acts in the intestine, the author infers that its action must be very rapid under the favorable conditions found in the duodenum—a fact which is of great physiological importance, since it is evident that at this rate all the fats would be split into fatty acid and glycerin in the time required for intestinal digestion, unless the action of the juice was checked or retarded in some manner.

The chemical products of the growth of *Bacillus anthracis* are described by Sidney Martin as including proto-albumose and dentero-albumose, with a trace of peptone, all of which have the same chemical reactions as the similar bodies formed in peptic digestion, an alkaloid, and small quantities of leucin and tyroxin. The mixture of anthrax proto- and dentero-albumose is poisonous, and produces œdema, with, according to the magnitude of the dose, sluggishness leading to stupor, coma, and death. After death, great local subcutaneous œdema is found, with congestion and sometimes thrombosis of the small veins. Peritoneal effusion is occasionally present, and the spleen is usually enlarged, dark, and congested, or simply congested without being greatly enlarged. The anthrax bacillus in digesting the alkali-albumen forms proto-albumose, dentero-albumose, and an alkaloid. The alkalinity of the albumoses may explain their poisonous properties, and is due to the fact

that the alkaloid is in a nascent condition in the albumose molecule. The bacillus forms the alkaloid from the albumen, and it is possible that the living tissues have a similar action when the albumose is introduced into a living animal.

Nutrition.—Of experiments on nutrition carried out on men under the direction of Dr. Van Noorden, one set established the fact that nitrogenous waste, in the case of diabetes, can be most definitely lessened by the ingestion of large quantities of carbohydrates. Fats can not take the place of these carbohydrates. Another set of experiments showed that when carbohydrates are given in increasing quantities over a prolonged period to a person in nitrogenous and calorimetric equilibrium, they lead for the most part to a storage of fat (95 per cent.), and to a less extent of proteid (5 per cent.). The author is of the opinion that this proteid is laid on the living cell as a sort of nonliving reserve proteid. A third set of experiments showed that when the food of a fat person is diminished to the requirements of a seven-to-ten-year-old child, then any increase of its proteid constituents leads to a storage of proteid with a simultaneously considerable loss of fat. Experiments upon the respiratory interchange of the person experimented upon showed that the intake of oxygen had been reduced to a minimum, and that the respiratory quotient was 0.7. The last set of experiments, made upon a gouty person, showed that with a constant diet the ratio of intake and output of nitrogen was very variable, at one time a large amount of nitrogen being retained in the body, while at another time much more nitrogen was excreted than was given with the food.

An account of part of the experiments on the nutrition of fasting men carried on by him and other observers was given by Dr. J. Munk, in the Physiological Society of Berlin, March 8. The same observers having some years ago made experiments on the fasting man Cetti, the outcome of which did not accord with the results of experiments made on dogs, they had more recently experimented again over a period of six days on another fasting man—Breithaupt. This man's nutrition was followed for several days on an ordinary diet before the period of fasting, and again after the fast had ended. The patient was allowed as much water as he wished during the fast. The output of nitrogen sank slowly and continuously during the whole period of fasting. The urinary phenol increased in amount up to the fourth day, and then sank to a minimum. Indol was found only in traces, and acetone was absent. The amount of chlorine and of alkali diminished progressively, and continued below the normal even after food was once more taken. The urine contained a large quantity of phosphoric acid, lime, and magnesia. Concerning the respiratory interchange, according to Prof. Zuntz, the intake of oxygen when at rest was the same as that of a normally fed person twelve hours after a meal. The respiratory quotient, varying from 0.66 to 0.69, was less than that due to the oxidation of fats alone or of proteids alone. During the fast the patient's power in turning a wheel against friction was the same as that observed when feeding, but fatigue set in much sooner, and was most marked in the

cardiac muscles. During the earlier days of the fast the consumption of oxygen when working was the same as for a normal person, but later on it became greater. The after effects of work lasted longer than when food was taken. The speaker regarded the extremely low respiratory quotient during the fast as possibly due to the splitting up of the proteids into glycogen and some other substance, which was then oxidized and gave rise to the small quotient observed. This view was supported by experiments made by Dr. Vogelius on the construction of carbohydrates in the fasting body.

Experiments by L. E. Shore to ascertain the fate of peptone when introduced into the lymphatic system, and to determine whether lymph cells can assimilate it or not, have shown that when injected into the bile duct peptone partly passes into the blood, and a certain amount into the urine; when injected slowly into the blood it is excreted in the urine; if the renal vessels are tied, it passes from the blood into the lymph; injected quickly into the blood, it may be in part excreted in the urine, but is chiefly thrown out into the lymph, and if the renal vessels are tied is thrown out of the blood into the lymph, and from the lymph in the tissues of the body is gradually carried to the thoracic duct, and then enters the blood again. Further, it was found that peptone introduced into the lymphatic system can be recovered unchanged; that the cells of lymphatic glands have not the power to assimilate peptone; that the cells of the spleen do not take up or transform it; that the liver can take no part in the normal transformation of peptone, and that the normal transformation of peptone is effected by the epithelial cells of the intestinal mucous membrane.

Differences having been remarked by many observers in the phenomena of diffusion between two liquids separated by an animal membrane, according as the membrane has been recently removed from the living body or has had time to undergo post-mortem changes, E. Waymouth Reid has made a more careful study of the subject. He finds that the normal direction of easier osmotic transference of fluid through the living skin of the frog is from the outer toward the inner surface; that the transference of fluid through the skin in this direction is intimately associated with the physiological condition of its tissues; conditions or agents tending to depress vitality diminish the transfer in the normal direction, while stimulants give rise to augmentation; that the cause of the easier transference of fluid from the outer toward the inner surface is probably to be found in the existence of an absorptive force dependent on protoplasmic activity, and comparable to the secretive force of the gland cell; and that, in consequence of the absorptive force acting from without inward, an alteration of the relations of the surfaces of the skin to the two fluids used in an osmosis experiment modifies the rapidity of the transfer of fluid from one to the other side of the membrane, according as the force exerted by the living tissues is with or against the osmotic stream.

In experiments by E. B. Poulton to determine whether the colors of certain lepidopterous larvæ are partly due to modified plant pigments de-

rived from food, larvæ from one hatch of eggs laid by a certain female insect were divided into three lots and fed, in darkness, respectively throughout their whole life upon (1) green leaves, (2) yellow etiolated leaves, and (3) white midribs of cabbage. The larvæ of the first and second lots became green or brown, as in nature, thus proving that etiolin, no less than chlorophyll, can become the basis of the larval ground color. Those fed upon white midribs of cabbage, in which neither chlorophyll nor etiolin was accessible, were entirely able to form the green or brown ground color. The production of dark superficial cuticular pigment was, however, unchecked. The experiment seems, in the author's opinion, to leave no doubt of the derivation of color from the chlorophyll of the food plant.

In experiments on the madder staining of dentine by Dr. W. G. Aitchison Robertson, rabbits were fed on madder for some time and were then killed, when the dentine was found to be stained. When other food was supplied for a time, and the feeding on madder was resumed afterward, two colored layers, with an intermediate layer, were found in the dentine.

Nervous System.—A special research, to ascertain what are the influences that determine the activity and fatigue of the central nervous mechanisms which excite the voluntary muscles to action, is described by Warren P. Lombard, of Clark University, Massachusetts. The experiments were made upon the writer himself, in exercising the flexor muscles of the second finger, generally with the left hand, by the pulling over a pulley of a weight, in the first experiments of 2, and in the later experiments of 3, 4, and 5 kilogrammes. They showed that, if one voluntarily contracts a muscle frequently, and each time raises a considerable weight with all his force, his power quickly begins to lessen, and sooner or later he ceases to be able to stir the weight. If, however, he continues to strive to raise the weight, many more or less complete recoveries of power periodically occur. Throughout the research the first failure to raise the weight was accepted as the sign of fatigue of the voluntary power. The first loss of power came somewhat sooner, and the recoveries of power were much more complete in the case of the author than of most men whom he studied. Apparently the central nervous apparatus through which he sends voluntary impulses to the motor nerves fatigues somewhat more quickly than is usual, and if compelled to act rapidly and vigorously tires sooner than the muscles. Thus he becomes incapable of voluntarily contracting his muscles at a time when they will respond well to direct electrical excitation, or to an impulse called out by irritation of the nerve. This weakness, if it is to be so regarded, is compensated for by great and rapid recuperative power, and therefore never interferes with his ordinary duties; and it is noticed only in experiments such as those described, or when he attempts to exert himself to the utmost for long periods of time, as in a contest in running, or in a boat race. The exercise involved in the research greatly increased the endurance of the central nervous mechanism involved in the experiments, but had apparently little effect upon

other similar structures. The amount of fatigue experienced by the central nervous apparatus in producing a long series of voluntary contractions does not correspond with the number of times that the muscle is stimulated, at least when the rate is not more frequent than once a second. It appears to depend rather on the strength of the impulses sent out, because the total height to which a given weight can be lifted by such a series of contractions is a much more accurate expression of the condition of the central mechanism than the number of times that the muscle can be contracted. Further, the fatigue of the central apparatus does not correspond with the amount of conscious effort exerted in the work, for very many maximal voluntary contractions can be made without fatigue, provided the weight is small. Indeed, it seems as if the strength of the impulses which are sent outward to the muscle depended not only on the voluntary effort, but on some influence which passed inward from the muscle itself. The influences which have been found to affect the voluntary power of the subject are to be looked upon as controlling the activity and fatigue of the special central nervous mechanisms, which develop or transmit the voluntary impulse to the nerve fibers that supply the flexor muscles of the second finger of the left hand. Enough experiments were made with other parts, however, to show that other similar mechanisms are influenced in the same way. The following influences were observed: 1. Those which lessen the ability to do voluntary muscular work; general and local fatigue; hunger; lessening atmospheric pressure, including the regular and irregular variations; high temperature, especially if associated with much humidity; tobacco. 2. Those which increase the ability to do voluntary muscular work; exercise; rest, and especially sleep; food; increasing atmospheric pressure, including regular and irregular variations; alcohol.

Though quantitative results as to the relative efficiency of these different influences can not be given, something as to their relative effectiveness may be stated. Exercise acts in the same direction as sleep and food, and is a very potent factor. While the two latter simply act to restore the strength, exercise increases the power. Sleep has a greater effect than food, and is much more beneficial than waking rest, perhaps because the restorative processes then go on unopposed. The supply of nutriment only fulfills one of the requirements for the recovery of strength. A rising barometer favors the action of exercise, sleep, and food to increase the power, while a falling barometer opposes them, and may overcome their influence and lessen the strength. Though the regular diurnal changes in atmospheric pressure undoubtedly influence the writer's power, the effect is a delicate one, which is readily obscured by more potent influences. Tobacco and alcohol act very vigorously. Tobacco may prevent the effect of a rising barometer or of food from showing itself, and seems even to lessen the strengthening effect of exercise. Alcohol, in small amounts, increases the strength to a marked degree, even when the barometer is falling. The effects of tobacco and alcohol, there-

fore, tend to neutralize one another, the action of one or the other being seen according to the strength of the dose. Both of these influences are temporary, and last but an hour or two. These statements refer to only small doses of alcohol. It is possible that, had large quantities of alcohol been taken, the primary strengthening influence would have been followed by depressing after effects.

In their study of degeneration and regeneration in peripheral nerve fibers after severance of their connections with the nerve centers, W. H. Howell and G. C. Huber divided the cases examined into two groups: Primary sutures, in which the surgical operation was performed immediately after the injury; and secondary sutures, in which the divided ends of the nerve were dissected out and freshened after the wound had begun to heal. In the latter group the time interval between the suture and the injury varied from a few days to years. Synopses, in tabular form, are given in the author's paper, showing the number of failures and successes for the different nerves operated upon, the average time required in the successful cases for the return of function to motor and sensory fibers respectively, and other points; and critical discussions of the cases are attempted. The general conclusions of the authors regarding the cases of primary suture are that the prognosis is very favorable. In all probability function will be restored completely or partially; that the prognosis is more favorable the younger the patient; that some form of animal suture is to be preferred, and the majority of surgeons employ the "direct method" of nerve suturing; and that the clinical as well as the physiological evidence is against the possibility of "immediate union." Of 80 recorded cases of secondary suture, 88 per cent. were successful, 50 per cent. were improved, and 12 per cent. might be regarded as failures. From a clinical point of view, then, it might be said that the prognosis in the operations for secondary suture is good. Improvement is almost certain, and in a large proportion of the cases complete success may be expected.

In the course of some researches respecting the functions of the cerebral heat centers, Dr. J. G. Adami made experiments to determine whether substances inducing typical fever in the intact animal lead to any rise of temperature when injected into the animal deprived of its hemispheres. Employing for this purpose the hen, he found that for the first few days after the removal of the cerebrum, when evidently the shock caused to the system was still persisting, the temperature regulating mechanism was thoroughly disorganized. The bodily temperature of the fowl responded to changes of temperature to which the normal hen is not or is very little sensitive. The author, however, obtained clear indications that the substances he experimented with—warmed egg and sterilized cultures of *Vibrio Metchnikovi*—when injected under proper conditions into the hen deprived of its hemispheres, lead to a marked rise of temperature. Whether such rise is truly febrile or not, and whether it can be produced in fowls minus their hemispheres at a later period, when

the system is in a more stable condition, are matters that have yet to be investigated.

The experiments of Bernstein and Wedenski showed several years ago that tetanic stimulation of a motor nerve in frogs causes no fatigue. Bowditch, by the help of curare, obtained the same results with reference to the cat and the dog, or to warm-blooded animals. Langendorff has adduced the persistence of toothache as illustrating the existence of the same immunity to fatigue in other nerves; and experiments by Szana point to the same conclusion with respect to the inhibitory fibers of the vagus in the rabbit.

Special Senses.—In a paper on the "Function of the Retina in the Perception of Color," Mr. W. F. Stanley, referring to Young's theory of color sensation, said that Prof. Rutherford had pointed out that there was no necessity for assuming that different nerves conveyed different color sensations, for as a telephone wire would transmit almost an infinite variety of sound vibrations, so the nerves of the retina were probably equally capable of conveying all kinds of light vibrations. Prof. Rutherford had further pointed out that the image of a star could not possibly cover three nerve terminals at once, and therefore could not be seen as white if Young's theory were correct. The author then described Helmholtz's experiments with a small hole in a screen illuminated by spectrum colors. For red illumination the greatest distance at which the hole could be seen sharply defined was 8 feet, and for violet $1\frac{1}{2}$ foot. When the hole was covered with purple glass, or with red and violet glasses superposed, and a bright light was placed behind, the eye, when accommodated for red light, saw a red spot with a violet halo round it, and when focused for violet light, a violet spot with a circle of red. These experiments show, the author thinks, that the chromatic sense in distinct vision under critical conditions, or where a single nerve or a small group of nerves is concerned, depends on the colors being brought to foci at different distances beyond the crystalline lens. He also infers that the same focal position in the eye can not convey simultaneously the compound impression of widely separated colors. Helmholtz's observations are further examined in the paper, and a series of zoetrope and color-disk experiments are described which tend to show that the eye can not follow rapid changes of color. Changes from red to violet could be followed much more quickly than those from violet to red. The red impressions were, however, more permanent. The observed effects were found to depend on the intensity of the light, and also on the distance of the eye from the colored surface. Summing up his observations, the author infers that by systems of accommodation of the eye, the colors of the spectrum are brought to focus on special parts or points of the rods or cones of the retina, such focal points being equivalent, by equal depths or distances from the crystalline lens, to a focal plane formed across the whole series of nerve terminals. That all the rays of light from an object, or part of an object of very small size and of any spectrum color, will converge to a point upon a nerve terminal, and that this terminal will be most excited by the light. In the

discussion of Mr. Stanley's paper in the Physical Society, London, Capt. Abney said that to be conclusive, the zoetrope experiments must be conducted with spectrum colors instead of pigmentary; that the statement about the size of star images being less than that of a nerve terminal would probably need revision; and that the modern view of color vision was to regard light as producing chemical action in the retina, which action gave rise to the sensation of color. On the author's theory, he could not see how color blindness could be explained. Prof. S. P. Thompson said that the gist of Mr. Stanley's paper seemed to be that lights of different colors were concentrated at points situated at different depths in the retina, the violet falling on the part nearest the crystalline lens, and the red farthest away. Another view of the action was that the different sensations might be due to the vibrations of longer wave length having to travel greater distances along the nerve terminals before they were completely absorbed.

The aqueous humor of the eye—the profuse escape of which was formerly supposed to entail the loss of the eye, but has since been ascertained to be not serious in itself—has been found by Dr. W. Nicati, of Marseilles, to be the secretion of a special glandular apparatus of the ciliary process, which he calls the “uveal gland.” The parts described as associated with or forming part of this uveal gland include an epithelium continuous at the ora serrata with the retina, and prolonged over the whole surface of the ciliary process to the attachment of the iris. This represents the gland, which the author estimates to have a surface at least 6 centimetres square. The cells constitute a single layer, with large oval or spheroidal nuclei, and rest on a layer of pigment cells continuous with that external to the rods and cones of the retina. Internal to the epithelium is the suspensory ligament, a special structure which extends from the tips of the ciliary processes to the lens, and is composed of delicate connective tissue and of the rigid friable fibers of Henle, among which some free blood corpuscles are found. These Dr. Nicati believes to be the remains of the vascular organ, which occupied this position before birth, the *tunica vasculosa lentis*, of which the pupillary membrane of the foetus is a part, receiving its vascular supply from the hyaloid artery. External to the secreting epithelium is a close network of capillaries, a continuation of the choriocapillaris, which ministers to the nutrition of the gland. The larger arteries supplying the plexus are the short ciliaries, and the veins returning the blood are the *venæ vorticosæ*. The nerves proceed from the plexus formed by the ciliary nerves given off by the nasal nerve and by the lachrymal ganglion. The ducts of the gland are represented by the canal of Petit, the circular marginal slit of the posterior chamber which separates the iris in front from the crystalline lens and the ciliary processes behind, and the slits connecting these spaces with each other: while the channels by which the aqueous humor is absorbed and carried away are lacunæ in the epithelial layer covering the crypts on the anterior surface of the iris, sometimes named the lymphatic lacunæ of Fuchs or the stomata of Nuck and Cornil, which open into a system of

lymphatic channels that are again continuous with the lymphatic sheaths of the anterior and posterior ciliary veins and of the *venæ vorticosæ*.

The results obtained by Herr Hocheisen in experiments on the sense of touch in the blind show that their muscular sense is far more acute than that of those who can see, and is more acute in the youthful blind than in those who are older, the sense in the latter being but little more acute to them in those who can see. Similarly the power of localizing was more acute in the young than in the older, and did not differ appreciably from that of those who can see. By practice both of these senses can be so sharpened in those who possess sight as to become ultimately as acute as in the blind. Eight subjects were experimented with, some of whom were born blind, and some became blind early in youth.

It appears, from the researches of Prof. Zuntz, that a taste sensation, as of something sweet, is increased to a very marked degree when some other stimulus is simultaneously applied to the organ of taste, even when the stimulus is too weak to produce any sensation alone. Thus, for example, a solution of sugar tastes sweeter if it is mixed with some solution of common salt so weak that it excites no saline taste. The same result was obtained by the addition of a solution of quinine, also too weak to give rise of itself to any sensation of taste.

Muscular System.—Physiological contraction, and even mere mechanical tension of the flexor muscles of the knee, have been found by C. S. Sherrington to exert considerable physiological influence upon the activity of the antagonistic group of muscles, the extensors. For instance, the elicitation of the “jerk” from the extensors can be rendered difficult for a time by appropriate excitation of the flexors, and can, on the other hand, be much facilitated by flaccidity or paralysis of the latter. From experiments made to determine that point it was found that the tonus of extensors is heightened by excitation of the antagonistic set, and conversely. While in mutual association of action of antagonistic muscles about other joints than the knee, movement in the same sense sometimes persists; the movement of response obtained is often reversed by section of the peripheral nerve or nerves supplying those muscles which predominate in the movement obtained, although diminished in force and extent, even after cutting the nerve to the predominant group of the antagonistic muscles. This indicates that in some cases there occurs, together with contraction of one group of muscles, concomitant relaxation of the antagonistic. This is more usual in the eyes than in the fingers.

Dr. Warren P. Lombard, of Clark University, Massachusetts, quotes the observations of Fehner, who spent two months in experiments on the subject, on the effect of exercise upon the power of endurance of the voluntary muscles. This observer took note of the time required to fatigue those muscles. He raised 2 dumb bells of 9½ pounds with extended arms over his head every other second, and lowered them in the intervening second. He found that the amount of fatigue which stopped the work came on at just about the same time for a considerable period. The first day the exercise lasted 104 sec-

onds, half of this time being spent in raising and half in lowering the weight. For the first few days fatigue of the part was felt, and indeed for fourteen days no marked advance was made. On the fourteenth day the exercise lasted 108 seconds. From this time on there was a gradual rise of the curve until the forty-first day, when, though there were many oscillations, the rise became very rapid. The oscillations were attributed to the conflict of the two influences, fatigue and exercise. The greatest time that the work was continued was 692 seconds, and this by excessive disturbance of respiration and circulation, the whole system, as it seemed, revolting against the work. Hence, Fechner concluded that the limit of the effect of exercise upon the muscles is not set by the muscles, but by the constitution. He suggests that by well-regulated exercise the constitution might be altered, and inured to bear fatigue.

In a great military march on cycles, executed by the Twenty-sixth Middlesex Cycling Corps, England, from Hitchin to Peterborough and back, a distance of 100 miles and 200 yards was covered in ten hours and fifty-seven minutes. All precautions were taken to avoid excessive pressure and to provide refreshment at convenient intervals; and although the weather and part of the ground were unfavorable, the men came out of the exercise without fatigue. The most interesting feature of the story, as told in the "Lancet," is that Major Knox Holmes, who was closing his eighty-third year, mounted on a tandem with a rider eighteen years of age, accompanied the corps, and arrived at the termination of the expedition five minutes in advance of the rest. He was a little distressed on dismounting from too hard riding in the last few miles, but soon threw off his fatigue and joined his companions at dinner with thorough zest. His condition is described as physiologically peculiar. In twelve weeks' new training he developed muscle in the most striking manner in the external and the internal vasti, the rectus, and the muscles which form the calf of the leg. It has become so entirely a part of physiological doctrine, the writer says, that after three-score years and ten there is no new development of muscle, that if he had not seen with his own eyes, as he had, this actual development in one whose age exceeded by thirteen years the traditional span of human life, he should have doubted the possibility of its occurrence.

Vegetable Physiology.—From experiments made in the Botanical Gardens at Buitenzorg, Java, Herr Haberlandt draws an argument against the view that the transpiration current is of first importance in the nutrition of land plants. The tropical plants showed transpiration greatly inferior in amount to that of European plants, yet they had luxuriant vegetation, and were able to convey nutritive salts to their highest parts. It is curious that, in spite of the great humidity of the air and the large amount of water in the ground, these plants often possess guards against too great transpiration, such as thick, cuticularized epidermis, deeply sunk stomata, and especially tissues adapted for storage of water. And the reason can not lie, as sometimes at the coast, in the presence of salt in the ground. Herr Haberlandt finds an explanation in the fact that

while the total transpiration is comparatively small, the hot sunny forenoons may occasion large evaporation. The transpiration in a forenoon hour was, in general, from 4 to 12 times that of an afternoon hour; sometimes as much as 20 or 30 times. The forenoon hours are by far the most favorable to assimilation, and it is most important to the plant that its turgescence be not then too much depressed, an end accomplished through those water reservoirs.

From recent researches on transference of material in plants, for example, by transference of starch in the potato, Herr Brasse is led to present the following view of what goes on: The assimilation of carbon in the sun's rays is manifested directly in deposition of starch in the chlorophyll grains. Through action of diastase in the leaves and at a temperature lower than that of its formation this starch is changed into reducing sugar, which spreads by diffusion from its place of formation to all the tissues of the plant. In certain parts, and especially in the tubers, the sugar is continuously transformed. The tubers, with regard to dissociation, act like the cold wall in vaporization of a volatile liquid in an inclosed space. The sugar content of all cells of the plant seeks to enter into equilibrium with that of the cells of the tubers in which the content is less, because a change of sugar into starch takes place, and the coefficient of this change is here less than that of the converse change in the leaf, the temperature of the tuber being less. Owing to this inequality, there is a transference of starch from the leaf into the tuber in which it passes through the intermediate stage of sugar. In a similar way Herr Brasse would explain the transference of nitrogenous and mineral plant materials and their storage in special organs.

Some interesting researches into the atmospheric sources of nitrogen as plant food have been made in the Agricultural and Veterinary School at Copenhagen. The proportions of nitric acid and ammonia in the rain water collected in the pluviometers of the experimental fields was measured for each month of the years 1880-'85. The quantity of ammoniacal nitrogen was relatively greater in winter and in cold springs, it oscillating in winter rains between 1.05 and 7.98 milligrammes per litre, and in summer rains from 0.7 to 1.5 milligramme. Observations made at other stations were confirmed, according to which summer rains are not always, as compared with those of other seasons, richest in nitric acid. In two years only out of the five years of experiment did the summer rain contain the most nitric acid. The quantity of ammonia much exceeded that of nitric acid; in one of the five years it was 84 times as much; yet in July, 1883, and August, September, and November, 1884, nitric acid was dominant. In total nitrogen, the summer rains—those of June, July, and August—except in 1883-'84, furnished less relatively than those of other seasons. From 14 to 32 per cent. of the year's nitrogen appears to have been furnished during the three months proper of vegetation (May, June, and July). The author remarks that the figures he gives are maxima, the investigations having been made near a large city. The importance to plants of nitrogenous combinations included in rain water should

not be regarded in calculating the amount that should be imputed for a rational agriculture. The walls of most cells, ducts, and the surface coverings of plants, with certain exceptions, are imperforate, or without any openings that can be demonstrated by the microscope. If gases pass through them, it must be in accordance with some law of diffusion or osmosis. Many experiments in this line, according to J. C. Arthur, have been tried, and the results have been of the most diverse character. The most astonishing and important results were obtained by Wiesner, in experiments conducted at Vienna in 1890-'91. He found that it was impossible to force gases through cell walls of any kind by any pressure they will stand, acting for any length of time. For instance, a bit of grape skin held up a column of mercury, 70 centimetres high, for seventy-five days, and a piece of cherry skin withstood a pressure of three atmospheres for twenty-four hours. Similar experiments were tried with cuticularized, suberized, liquefied, and simple cellulose tissues, from many sources, and with uniformly the same results, whether the tissues were moist or dry, alive or dead. But in the same set of experiments it was found that if gases can not be forced through cell walls, they will readily pass through by simple osmotic diffusion. All cells permit the passage of gases by diffusion when moist, dependent upon the coefficient of absorption and the density of the gas. Cuticular and corky formations also permit the passage of gases when dry. Thus we see that gases may be forced through the stomata, or breathing pores, by varying pressure, but can pass through the epidermis and bark of plants only by diffusion. We therefore arrive at the conclusion that the gases inside and outside of the plant are brought to an equilibrium by direct interchange through the stomata and intercellular spaces, aided by the comparatively slow process of diffusion through the whole surface of the plant, both above and below ground.

The function of oxalic acid—one of several plant stuffs, including also alkaloids and tannin possessing the property—of protecting plants from animals has been studied by Herr Giessler, in species of rumex, oxalis, and begonia. The acid mostly occurs in the epidermis and peripheral tissues of the vegetative organs; parts under ground have none. The leaves show most, but the acid may be found in the stem and the leaf and flower stocks. Curiously, it does not, like other protective matters, appear in young organs. The older and more sappy the tissues, the more oxalic acid do they contain. Snails, which avoided those plants in the natural state, ate them when the oxalic acid had been precipitated. The substitution of various means of protection for one another was elucidated by Stahl; plants not protected mechanically have chemical protection, and *vice versa*. In the plants studied by Herr Giessler mechanical protection is deficient. Tannin is found in the organs that have little or no oxalic acid. These two substances "vicariate" with each other also in different species of a genus. In many tissues both occur together. The protective function of a secretion does not exclude other functions. Thus, regarding the epidermis as a water reservoir, the osmotically very active

organic acids doubtless play an important part in the filling of the cells with water. The occurrence of begonia and oxalis species in very dry places, as also the deficiency in means of protection against transpiration, more pronounced the higher the quantity of acid, put this function of oxalic acid in a still clearer light.

PORTUGAL, a constitutional monarchy in southwestern Europe. The upper house of the Legislature is a Chamber of Peers composed of 52 hereditary members, 13 prelates, 139 members nominated for life by the King, and 50 members elected by delegates of districts and learned bodies from the class paying the highest taxes. When the hereditary peerages become extinct by the death of their present possessors there will be 100 life peers. The Chamber of Deputies has 180 members, 168 of whom represent Continental Portugal and the Azores and Madeira, and 12 the colonies. They are elected for four years by the direct votes of male adult Portuguese citizens who have an annual income of at least 100 milreis. The King of Portugal is Carlos I, the third monarch of the line of Braganza-Coburg, born Sept. 28, 1863, who succeeded Luis I, his father, Oct. 19, 1889.

The ministry at the beginning of 1893 was as follows: President of the Council and Minister of the Interior, J. Dias Ferreira; Minister of Public Works, Commerce, and Industry, P. V. da Costa Sequeira; Minister of Finance *ad interim*, J. Dias Ferreira; Minister of War, Gen. Pinheiro Furtado Coelho; Minister of Marine, Capt. Ferreira do Amaral; Minister of Justice, Telles de Varemculos; Minister of Foreign Affairs *ad interim*, Capt. Ferreira do Amaral. The ministry here named was constituted in January, 1892.

Finances.—The budget for 1893-'94 makes the total receipts 43,674,457 milreis (1 milreis= \$1.10), of which 11,020,430 milreis were derived from the land, income, and other direct taxes, 20,476,860 milreis from import duties and various small indirect taxes, 1,725,800 milreis from supplementary taxes, 2,002,000 milreis from registration, 1,504,500 milreis from stamped paper, 280,000 milreis from lotteries, 3,640,305 milreis from railroads, telegraphs, and other public property, and 3,024,562 milreis are *recettes de ordre*. The total ordinary expenses are set down as 42,860,427 milreis, and the extraordinary expenses as 1,816,595 milreis, making a total of 44,677,022 milreis. Of the ordinary expenditure, 18,063,118 milreis are for the public debt, 1,894,050 milreis for the floating debt of the treasury, 1,894,050 milreis for pensions, etc., 500,000 milreis for loss by exchange, 3,143,419 milreis for financial administration, 2,280,415 milreis for the Ministry of the Interior, 1,038,608 milreis for the Ministry of Worship and Justice, 5,123,656 milreis for the Ministry of War, 3,542,823 milreis for the Ministry of Marine and the colonies, 390,210 milreis for the Ministry of Foreign Affairs, 4,639,642 milreis for the Ministry of Public Works, 525,000 milreis for the civil list and appanages, 99,270 milreis for the Cortes, and 60,465 milreis for the savings institutions. A commercial treaty was formed with Spain early in 1893. The treaty is to last ten years. Portugal reserves the right to concede special advantages to Brazil. Owing to the scarcity of

flour, the Government in September reduced to 15 reis per kilogramme the duty on foreign wheat till July 31, 1894.

The new consolidated debt on June 30, 1890, amounted to 573,211,934 milreis, of which 258,214,034 milreis were the new internal bonds bearing 3 per cent. interest, 210,902,779 milreis represent the foreign debt of £50,801,576 sterling funded at the same rate, and 104,178,466 milreis were amortizable debts bearing 5, 4, and 4 per cent. interest. There remained unconverted 125,036 milreis of the internal and 2,252,368 milreis of the foreign debt. The amount of interest paid on all the debts in 1889 was 17,730,807 milreis.

The Army and Navy.—The law of Sept. 12, 1887, introduced obligatory service for three years from the age of twenty. A decree of July 23, 1891, reduces the service with the colors to eight months in the second and four months in the third year. Substitution is allowed and leaves are granted under the decree of June 30, 1891, sufficient in number to restrict the effective to 22,000 men. The contingent for 1893 was 14,264 men. Including the furloughed, the permanent army in 1892 numbered 2,089 officers and 25,658 rank and file, with 3,985 horses. With the municipal and fiscal guards included, there were 2,846 officers and 32,625 men. The war effective reaches 4,000 officers and 150,000 men, with 23,000 horses and 264 guns. For 1894 the peace effective has been fixed at 80,000 men.

The navy consists of 1 armored corvette, of 2,422 tons, with 6 cannon above and 3 below 10 centimetres; 6 corvettes with 6 large and 42 small guns; 14 gunboats, with 17 large and 36 small guns; 6 stationary vessels, with 12 small guns; 9 small gunboats; 2 transports; and 4 torpedo boats.

Commerce.—The special imports of merchandise for 1891 were 39,529,946 milreis and of specie 8,289,727 milreis. The special exports of merchandise were 21,378,390 milreis and of specie 29,803,648 milreis. The chief exports are cereals, cotton goods, machinery and instruments, iron, coal, sugar, woolens, codfish, raw cotton, railroad material, chemicals, animals, timber, wool, skins and leather, silks, rice, coffee, and butter and cheese. The values of the leading exports for 1891 were as follow: Wine, 10,122,000 milreis; cork, 2,951,000 milreis; fish, 1,416,000 milreis; copper, 1,033,000 milreis; animals, 403,000 milreis; onions, 288,000 milreis. Of the goods imported, 34 per cent. in value consisted of articles of aliment, 3.5 per cent. of animals, 28.9 per cent. of raw materials, and 33.6 per cent. of manufactured articles, while of the exports 75.5 per cent. consisted of foods and drinks, 2.3 per cent. of animals, and 23.2 per cent. of raw materials.

Navigation.—There were entered 3,708 steamers, of 5,181,000 tons, and 2,554 sailing vessels, of 363,000 tons, engaged in foreign commerce at the ports of Portugal in 1891, and cleared 3,721 steamers, of 5,187,000 tons, and 2,720 sailing vessels, of 351,000 tons. The merchant navy in 1891 consisted of 67 steamers, of 108,601 cubic metres, and 486 sailing vessels, of 101,711 cubic metres. The Royal Mail Steamship Company, which formerly traded with south-east Africa and afterward with Brazil, became bankrupt in 1893.

Communications.—There were 1,335 miles of railroads in operation in 1891 and 96 miles building. The state owned 505 miles. The post-office in 1891 carried 20,851,000 domestic letters, 4,768,000 postals, and 20,389,000 other pieces, and 7,593,000 foreign letters, 270,000 postals, and 4,902,000 other pieces, besides those forwarded through. The total length of the state telegraph lines in 1891 was 3,985 miles, with 8,839 miles of wire. The number of private internal messages for that year was 582,066, and of international messages 584,619. The receipts of the post-office from mail and telegraphs were 6,057,789 francs and the expenses 7,196,653 francs. A British company in the autumn of 1893 laid down a cable from Lisbon to the Azores, which it expects to continue to North or South America.

Change of Cabinet.—The Dias Ferreira ministry, after the meeting of the Cortes in January, 1891, had a conflict with the Finance Committee of the Chamber, which wanted to consider the budget and the plan of new taxation, and thus calculate the means at the disposal of the Government for paying the interest on the debt, while the ministry insisted on first receiving sanction for the decree of June 18, 1892, cutting down the rate of interest on the foreign debt by two thirds. Rather than face a Cabinet crisis, the Chamber supported the Government for the nonce. There was much dissatisfaction with the Cabinet among the Conservatives as well as among the Progressists and Republicans. The wine growers believed that their interests had been sacrificed for the benefit of distillers. The Republicans led the attack on the moribund ministry, which had submitted a scheme of exceedingly onerous taxation; and when Dias Ferreira found that he could not obtain the co-operation of the Chamber in his plans for settling with the foreign creditors, he proposed, anticipating a hostile vote, to prorogue or dissolve Parliament. A fresh protest from the German Government against any solution of the question of the external debt that had not the consent of the bondholders may have impelled him to seek escape from office and the responsibility of carrying out his declared purposes. Dissolution the King refused to sanction, whereupon the Cabinet resigned on Feb. 21, 1893. Hintze Ribeiro was asked to form a new one, and on Feb. 23 it was constituted as follows: President of the Council and Minister of Foreign Affairs, E. R. Hintze Ribeiro; Minister of the Interior, João Franco Pinto Castello Branco; Minister of Justice and Ecclesiastical Affairs, Antonio de Azevedo Castello Branco; Minister of Finance, Augusto M. Fuschini; Minister of War, Col. L. A. Pimentel Pinto; Minister of Marine and the Colonies, Capt. J. A. de Brissac dos Neves Ferreira; Minister of Public Works, Commerce, and Industry, Bernardino L. Machado; Minister of Public Instruction and Fine Arts *ad interim*, J. F. Pinto Castello Branco. The new Cabinet represented chiefly the Regenerador party, led by Serpa Pimentel, from which the majority of its members were taken. The ministerial programme embraced amnesty for political offenses, freedom of the press to criticise the existing responsible ministers, an effective Government control over the banks, and the payment of the foreign

debt as far as possible, without imposing new taxes, none at any rate that would fall on the working classes. The Cortes adjourned till May 15 to give time to the ministers to frame a new budget and the other promised measures after sanctioning a general amnesty to press, election, and political offenders, excepting some military officers who issued a *pronunciamiento* at Oporto on Jan. 31. Negotiations with the foreign creditors, which Dias Ferreira had broken off with the intention of cutting down the interest payments to one third the legal amount when they were willing to give up one half in view of the financial straits of the Government, were resumed by Hintze Ribeiro. The alcohol monopoly established by a decree of July 8, 1892, was canceled on the ground that it was illegally constituted and had withheld the royalties due to the state. The new Finance Minister, who was a Socialist, with a disposition to collect the taxes more rigorously than his predecessors and encash all arrears, and also prune down expenses, submitted a budget for 1894 which showed a saving of 1,875 contos (1 conto of reis = 1,000 milreis) in the public services and a surplus of 800 contos in the ordinary budget, but a deficit in the extraordinary budget. An arrangement was made with the foreign bondholders whereby they were guaranteed 33½ per cent. of the regular interest in gold plus half any excess of revenue above 11,400 contos from imports, excepting tobacco and grain and exports, excepting port wine, and half the benefit of any decrease in the gold premium below 22 per cent. The holders of the internal and external debts should have exactly the same privileges. This arrangement was approved by the Chamber on May 16. A plan of increasing the paper currency proposed by the preceding ministry was rejected by Fuschini, who fixed the limit of circulation at 52,000 contos. Among the new taxes was one of 12 per cent. on dividends or profits of foreign banks doing business in Portugal. The others were designed to affect principally the richer classes. Increased taxes on real estate, certain articles of consumption, and domestic alcohol were expected to realize 1,700 contos. Special taxes were imposed on foreign insurance and industrial companies, against which the British Government protested.

Colonial Possessions.—The Portuguese possessions in Africa comprise the Cape Verde Islands, Portuguese Guinea, St. Thomas and Prince's Island, Angola, and the state of East Africa, having an aggregate area of 840,000 square miles and a population estimated at 13,482,000. In Asia, Goa, including Damão and Diu, Macao, and Timor have a combined area of 76,700 square miles and 881,000 inhabitants. The budgets of the colonies for 1891 make 3,784,809 milreis for receipts and 3,910,105 milreis for ordinary and 785,080 milreis for extraordinary expenses. The imports of East Africa in 1891 were £215,655 sterling in Mozambique and £497,533 in Delagoa Bay for imports, and £111,493 in Mozambique and £895 in Delagoa Bay for exports. The imports of Angola were valued at \$5,477,629, and the exports at \$4,129,000. The chief exports are coffee, gum, wax, and ivory. There are 142 miles of railroad in Angola built and 217 miles under construction.

In East Africa the Delagoa Bay Railroad has a length of 51 miles. The Zambesi and Beira Railroad had been completed for a length of 75 miles at the end of 1893, and 35 miles more were under construction. An English company was authorized in May, 1893, to build a railroad from Quilimane to the Shire river. The Portuguese extended their posts in 1893 to the confluence of the Limpopo and Elephant rivers, against which the native chief Gungunhana, who has previously given them much trouble, raised a protest. A joint commission that was appointed to delimit the boundary between Portuguese East Africa and the territory of the British South Africa Company could not conclude its labor in the beginning of 1893, because in the district between Massikesse and Chimanamane Ennes, the Portuguese commissioner would not concede to Great Britain the rich Mutare valley, in which valuable gold veins had been discovered. A new customs tariff for Portuguese East Africa introduces differential rates of 40 or 50 per cent., or higher, in favor of certain Portuguese products, as 40 per cent. on alcoholic beverages. In Goa there is a railroad, 50 miles in length, connecting with the British West of India Railroad. The Portuguese Government used to hand over to this British company, having guaranteed its bonds, the subsidy of 400,000 rupees that it received from the Indian Government under the treaty of 1878. That treaty having been abrogated by Great Britain, the excise duties of Goa, amounting to 600,000 rupees, have now been abandoned to the company.

PRECIOUS STONES. The growing taste for art in the United States, shown in the improved methods of book illustration, a fondness for etchings, the production of new forms of jewelry and the manufacture of unexcelled silverware, is further manifested in a greater appreciation of gems and the exercise of increased judgment in their selection. During the past decade new stones have come into favor, some neglected ones have regained their popularity, and others have been thrown out entirely. Rubies were considered expensive ten years ago, but at present they are still higher, an eight-carat stone being quoted at \$33,000; and cameos, no matter how finely cut, could not now find purchasers at one fifth their former value. A syndicate of French capitalists has been organized to control the topaz mines of Spain, in the expectation that after twenty years of disfavor this gem will again find itself in fashion.

South Africa.—Originally the mines of Kimberley were worked as 3,288 separate claims, each 31 feet square, with a 7½-foot roadway between every pair of claims; but since 1877 these have been gradually consolidated until at present they are united into fewer than 40 companies. The primitive method of washing by sieves has been replaced by the most ingenious and powerful machinery, which, though it be eyeless, allows fewer diamonds to escape than would the keenest and best disciplined army of washers. Originally miles of wire cable, to which were attached buckets for carrying the refuse running from individual claims, were stretched across the mine in all directions. Some of these were almost level with the surface, while others were cut down 200 feet, and still

others 100 feet, yet all were worked independently. At the sides were endless belts with pockets for carrying the earth. The result of this was that rock was dropped so recklessly in transit that it was dangerous to stand around the edges of the claims. Not only was the loss of life great from this source, but also from the falling of immense masses of reef, loosened by the blasting, which sometimes buried a score of men at once. Steam railroads are now run into the mine, parts of which have been leveled, and millions of tons of reef have been removed. The yellow soil on the surface, which overlay the blue stuff, pulverized so readily that it could be taken to the washing machine direct; but as claims were sunk down into the blue, the rock grew harder, and dynamite became necessary. After the earth is raised, it is put on the sorting ground, where it is disintegrated by the action of water and

nets (some of which, exceedingly rich in color, are sold under the name of "Cape Rubies") and other heavy minerals are concentrated together in the lower part of the "compound." So thoroughly does it pulverize the rock and earth that all the diamonds, even of the size of a pin head, are saved.

A prize of £5,000 was offered for the best tunnel or shaft system for use at the Kimberley mines, and it was awarded to the Jones system,

which is on the cofferdam principle. There are 7 shafts and inclined planes in the Kimberley mine alone, all sunk at some point in the reef outside the mine. From 11,000,000 to 13,000,000 gallons of water were annually hoisted from this mine at a cost of 6d. a load of 100 gallons. In addition to many miles of aerial tramways, there are over 170 miles of tramway around the 4 Kimberley mines, 2,500 horses, mules, and

the atmosphere. It is then broken by hand and taken to the "compound," or diamond-sorting machine, into which the rock is thrown from the sorting and breaking floors. After being more finely ground, it is passed into large vats containing immense centrifugal wheels, by means of which the rock is finely divided. The lighter materials—such as mud, quartz, and mica—are then floated out, while diamond gar-

oxen, and 850 steam engines, shafts, and other appliances, representing 4,000 horse power, are employed in the work. A million pounds are annually expended for labor, and over £1,000,000 for fuel and other supplies. The gross capital of the companies is nearly £10,000,000. Over 10,000 natives, each receiving £1 a week, and 12,000 European overseers at an average wage of £5, are employed. The old system of

open working has been abandoned, and a rock shaft has been completed that taps the lower levels.

In five years the De Beers mine yielded 344,015 carats, valued at £3,450,338, an average of £1 6d. a carat. This includes everything taken from the mine. At the beginning the yield was four tenths carat a load, but, as the mining has been carried to a greater depth, the output increased until last year it was eight tenths carat. The average value of a carat of diamonds for some years from the respective mines was as follows: Kimberley mine, 17s. 6½d.; De Beers mine, 17s. 8d.; Bultfontein, 18s. 2½d.; Dutoit's Pan, 24s. 7½d.; River Digging, 47s. 6d. The product of the last-named mine, while only $\frac{1}{12}$ of the weight in carats, was worth $\frac{1}{4}$ of the entire product, the stones averaging of a much finer quality. The yield of the African mines has been great, and the diamonds have averaged much larger than those from the older mines. The discovery of a 17-carat stone in the Brazilian diggings was sufficient to secure the freedom of the slave who found it; but stones of this size are found by the hundred in Africa. One fifth to one quarter of all the yield, it is estimated, have never reached the proper owners, as the native diggers swallow and conceal the diamonds in every possible manner. Hence it became necessary for the companies, in self-defense, to take extraordinary precautions against this great loss, and overseers or special searchers are appointed to make the most thorough examination of all who leave the mines. None but those authorized by law, termed patented agents, less than 50 in number, are allowed to purchase or even to possess rough diamonds at Kimberley. The actual loss of the diamonds would not have been so great but for the irregular diamond buyers, or "I. D. B's.," as the "fences" are called, who sent the stones to England and undersold the company in the London market. This pilfering was in a great measure checked by the adoption of the "compound system," by which the "boys" are housed and fed under contract for a certain term, and provided with amusements and liquor. They are thus kept apart from the influences of the vicious whites, who instigate them to crime with "Cape smoke" in their "canteens," as the grogeries run by the I. D. B's. are called. Visitors who buy from native diggers what they suppose to be valuable diamonds, and secrete them until they have passed beyond the officials, find to their disgust that they have purchased facsimiles in glass, perfect even to the characteristic yellow tint that is peculiar to many diamonds from this locality.

The "Victoria," the "Great White," or the "Imperial" diamond is supposed to be from South Africa. It is the largest brilliant in the world. The original weight of the stone was 457½ carats, or 3½ ounces Troy. It is believed that it was discovered in one of the Kimberley mines. It is supposed that during the summer of 1884 the stone was found by one of the surveillance officers of the Central Mining Company. His duty being to search others, he was not searched himself, and so smuggled the stone through the searching house. He then communicated with 4 illicit diamond buyers, and £3,-

000 is said to have been the price he obtained for the stone. To prepare for the transportation of the stone, the 4 I. D. B's. assembled at night, and after a debauch 2 of the party lost their share by gambling. The other 2 reached Cape Town in safety, where diamond laws are not in force, and from a dealer there they received £18,000 in cash for the stone. An outward duty of one half of 1 per cent. is collected on all shipments of diamonds from Cape Colony, but this diamond is said to have been carried by one of the passengers of a mail steamer, and was undeclared. It was next heard of in London, where it caused considerable sensation at Hatton Garden, the great diamond market. After some time had been spent in trying to find a capitalist who could afford to buy the gem, a syndicate was formed of 32 shares, and the stone was bought for £45,000 cash, on condition that when it should be disposed of each shareholder should receive a thirty-second part in the profits. Before cutting, it was estimated that the crystals would furnish either of the following gems: As a briollette, 300 carats; as a drop, 230 to 240 carats; as a lozenge, 250 carats; and as a mathematically-perfect brilliant, 150 carats. If cut in the latter form, it would give cleavages that would yield one 40-carat and one 20-carat stone, and 40 carats of smaller stones. It was decided to cut it into the largest possible brilliant, still preserving a good shape, and Amsterdam was selected as the place where the gem could best be cut. It was accordingly sent to the polishing mills of Jacques Metz, who erected a special workshop for the purpose, and selected M. B. Barends to cut it. In order to obtain the brilliant cutting, a piece was cleaved off which furnished a 19-carat diamond, and this was sold to the King of Portugal for £4,000. The cutting of the large stone, which was begun in the presence of the Queen of Holland, took about twelve months; for instead of being cut by abrasion with another diamond, as is usually done, it was polished down on the scarf or wheel, and a great amount of time was consumed in allowing the stone to cool off when it had become heated after an hour's running on the wheel. The stone in its finished condition weighs 130 carats, and is a beautiful, perfect, steel-blue diamond, and is the largest brilliant in the world, although flat on one side. It is 39.5 mm. (1½ inch) long, 30 mm. (1¼ inch) wide, and 23 mm. (1 inch) thick, being exceeded in size by one diamond only, the Orloff, belonging to the Russian Crown. This weighs 194½ carats, but it is a large deep rose, and not a brilliant. The "Victoria" exceeds the "Regent" in weight by 44½ carats, while the "Kohinoor" weighs only 106½ carats.

The "Tiffany" diamond weighs 125½ carats. It is a "double-deck" cut brilliant, absolutely perfect, and undoubtedly the finest large yellow diamond known. It was found in the Kimberley mine in 1879, and was cut in Paris. One of its most pleasing features is that it not only retains the rich yellow color by artificial light, but it is then even more beautiful than by day. It has 40 facets on the crown, 44 facets on the pavilion or lower side of the stone, and 17 facets on the girdle—in all, 101. Owing to its deep color, it is a finer stone than the historical "Star of the

South" (125 carats), which was purchased by the Maharajah of Baroda for \$400,000 at the World's Fair held in Paris in 1867. It also rivals the "Florentine," which weighed 138½ carats and was sold for 2,000,000 florins, but it is only a long double rose or drop, and not a brilliant.

"Du Toit 1," which weighs 244 carats in the rough, the "Great Orange" weighs 110 carats, the "Porter Rhodes," a perfectly white stone of 150 carats before cutting, and many other large stones have been found in the Kimberley mines. In March, 1888, there was found in the De Beers mine an octahedral crystal of diamond weighing 428½ carats. It is not entirely white, having a slight yellow tinge, and was valued at £3,000.

More diamonds of over 75 carats after cutting have been found since the African mines were opened than were known before. Thirty-eight million carats of diamonds, weighing over 7½ tons, have been found here. In the rough their aggregate value is £50,000,000, and after cutting £100,000,000, or nearly \$500,000,000 more than the world's output during the two preceding centuries. Of the whole yield, not more than 8 per cent. can be said to be of the first water, 12 per cent. of the second water, and 25 per cent. of the third, while the remaining 45 per cent. is called boart, a substance that when crushed to a powder is used for cutting hard substances and engraving. This must not be confounded with the carbon (carbonado) found in Brazil, an uncrystalline form of the diamond which is used in drills and has never been found in South Africa, and is worth from 6 to 10 times as much as boart. Nothing will cut glass but the natural crystal edge of a diamond. Glass will scratch glass, while even a cut diamond or a cleavage face will only produce a scratch, although almost every finder of a curious pebble is sure that it will cut glass like a diamond.

Brazil.—The diamond mines at Salabro, near the river Pardo, Brazil, known as the Canavieiras, were discovered in 1882 by a miner who had worked in the earlier and now nearly exhausted mines. The gems were found at a depth of about two feet in red gravel, are fine in quality, and are remarkable for their purity and whiteness, the crystals being such that scarcely any cleaving is necessary. When the Brazilian mines were discovered, the stones were sent to India to enter the European markets in Indian wrappers. Similarly, diamonds from Africa were sent to Canavieiras to be shipped to Europe as the product of that mine. Other Brazilian mines have been only slightly worked of late years. The black diamond, carbonado, or boart, used for diamond drills, saws, etc., has fluctuated in price very much.

Specimens of that very curious form known as "round boart," found only in Brazil, were shown at the Amsterdam exhibition of 1882. They were perfect spheres, the result of a multiple twinning of the cubic form of the diamond. In order to determine its hardness, one of these was cut into the rude outline form of a brilliant by Tiffany & Company, who placed its table on an iron polishing wheel with a little diamond dust, revolving at the rate of 2,800 a minute. The circumference of that part of the wheel on

which the diamond was placed was about 2½ feet. It remained there ten hours a day for one hundred days, so that the surface that traveled over this diamond amounted to 80,000 mles. Four and, at times, 8 pounds of pressure were added to the usual 2½ pounds and 2½ pounds of the clamps or holder, while for a time 40 pounds extra were added, causing the diamond to throw out scintillations several feet long. The wheel was plowed up and ruined, yet no polish was produced, and the diamond was only slightly ground away.

Australia.—About 12,000 diamonds have been found in the Tertiary gravels and recent drift near Bingera, in Inverell, Australia; also along the Cudgegon river, 160 miles northeast of Sydney, and in other districts. The colors are white, straw, yellow, light brown, pale green, and black. The largest stones found were cut into gems weighing 8½ and 3 carats respectively. A trial made by the Australian Diamond Mining Company produced 190 diamonds, weighing 197½ carats, from the washing of 279 loads of earth.

United States.—The similarity of the South African peridotite to a peridotite found in Elliot County, Ky., led H. Carvil Lewis to suggest interesting possibilities there, and John W. Powell, director of the United States Geological Survey, sent Joseph S. Diller and George F. Kunz to examine the Kentucky peridotite. The associated minerals were identical with the South African, the pyrope garnet, ilmenite, biotite, and pyroxene being present, but by analysis of the inclosed carbonaceous shales from which it is believed that the diamond is formed, it was found that the Kentucky shale contained only 681 per cent. of carbon, while the South African contained 85 per cent. and could be readily ignited with a match. Hence, unless the peridotite has penetrated the older and richer Devonian shales, the probability of finding diamonds there has been considerably lessened by the investigation. A beautiful twinned hexoctahedral diamond crystal of 4½ carats was found in Dysartville, N. C., in June, 1886. A boy discovered the "pretty trick," as he called it, at a spring, and it was some time before it was suspected to be a diamond. None of the associations of the diamond were observed at the spring, therefore it is probable that the stone was carried there by some miner who was washing up his gold and failed to notice the shining crystal among the "wash-up." It was of a faint grayish-green tint, quite perfect as a gem, and would make, when cut, a stone worth about \$100. A number of stones called diamonds have been found at Brackettstown, N. C., but they have proved on examination to be transparent zircon or smoky quartz.

Meteoric Diamonds.—A meteoric stone weighing about 4 pounds fell on Sept. 4, 1886, at Novy Urej, Krasnoslobodsk, in the Government of Penza, Siberia, in which M. Latchinoff and Jorefeif discovered what they supposed to be diamonds of microscopic size. In an insoluble residue small corpuscles showing traces of polarization were found, harder than corundum, and having the density and other characteristics of the diamond. A small piece of the meteorite treated with solvents gave a residue of 12 small trans-

parent bodies. One of these, examined by George F. Kunz, was either a cube with faces of the tetrahedron or else a distorted trigonal tris-octahedron. The others were very much distorted, and two resemble the latter form, which is one of the principal diamond forms, and the colors were either pink or light brown. From their smallness a determination of the hardness could not be made, but by grinding with a sapphire 4 particles of the meteorite a number of minute but deep scratches on each polished face of 9 different sapphires were made with each piece of meteorite. These scratches are characteristic of the diamond. Lazarus Fletcher, of the British Museum, read a paper on a meteorite which was discovered in the sub-district of Youndeggin, Australia, in 1884, and announced that he had found a new form of graphite of cubic form, with the hardness of 2.5 and a specific gravity of 2.12, to which he gave the name of "cliffonite." It was examined with a $\frac{1}{2}$ -inch objective, and from its structure Mr. Fletcher concluded that, while it differed from native graphite, the sharpness, separateness, and completeness of the crystal, the brightness of the faces, the delicacy of the acicular projections, and especially of the obtuse, almost flat, square pyramids of some of the faces, were sufficient to prove that the form never had any other than its present tenants; in other words, that it was not a pseudomorph. When in the cubes, the diamond has faces not very unlike those of the Youndeggin crystals, and showed a similar beveling of its edges by the rounded tetrahedra.

Properties of the Diamond.—Considerable attention has been given to the alleged power of diamonds to emit light in absolute darkness. William Crookes, in his experiments on the phosphorescence of various colored diamonds, found that those glowing pale blue had the longest residual glow, followed by the yellow. He was unable to detect any glow in reddish diamonds. A large greenish diamond, very phosphorescent, shone almost as brightly in the phosphoscope as out of it. Crookes says: "Next to the diamond, the ruby is, perhaps, the most strikingly phosphorescent stone I examined. It glows with a rich full red, and a remarkable feature is that it is of little consequence what degree of color the earth or stone possesses naturally, the color of the phosphorescence being nearly the same in all cases; chemically precipitated, amorphous alumina rubies of a pale reddish yellow, and gems of the prized pigeon-blood color, glowing alike in the vacuum, thus corroborating Edouard Becquerel's results on the action of light on alumina and its compounds in the phosphoscope. The appearance of the alumina glow in the spectroscopic shows a faint continuous spectrum ending in the red near the line B; then a black space, and next an intensely brilliant and sharp red line, to which nearly the whole of the intensity of the colored glow is due.

Many large diamonds, if at all imperfect or of inferior color, are cleaved into smaller stones, in which the poor color is less apparent, as it is only the white diamonds that increase in value as they are larger.

There are about 12 cutting establishments in this country, employing from 1 to 50 men each,

and in all about 100, with salaries from \$20 to \$50 a week. Most of the cutting is of a high class, some shops being almost entirely employed in recutting stones that were cut abroad. Ten years ago nearly all the diamonds used in the United States were purchased through brokers or importers; but, owing to the growth of the diamond business and the facilities for travel, many of the large retail houses now buy their diamonds direct in the European markets, and some have even established agencies there. In 1877 an international syndicate composed of London, Paris, and Amsterdam jewelers, wishing to establish a uniform value for the carat, confirmed 205 milligrammes as the standard, and this was generally accepted.

Henry D. Morse, of Boston, was the first to cut diamonds in this country, and the best cutters in the United States received their training under him. Besides educating young men and women to his art, he showed the world that diamond cutting, which had so long been a monopoly of the Hollanders, was degenerating in their hands into a mere mechanical trade. His treatment of the diamond gave a great stimulus to the industry. Shops were opened in the United States and London in consequence of his success. He studied the diamond scientifically, and taught his pupils that mathematical precision in cutting greatly enhances the value as well as the beauty of the gem. In his shop a machine for cutting diamonds was invented that did away in a great measure with the tediousness and inaccuracy of the old manual process, and it is due to him that we now have the best cutters in the world. He died in Boston in January, 1888.

The jewelery of watches in the United States is estimated to require about 10,000,000 to 12,000,000 jewels a year, 5,000,000 being ruby and sapphire, and 7,000,000 garnet jewels, valued at about \$300,000. The larger part of these are imported, but the Waltham Company alone employs about 200 persons in the cutting of its jewels. At least 15,000 carats of board are used annually for this purpose.

Formation of the Diamond.—It has been suggested that the South African diamonds were formed in a sort of volcanic mud; that the action was hydrothermal rather than igneous, the diamonds being the result of the contact of steam and magnesian mud under pressure upon the carbonaceous shales. Sir Henry E. Roscoe, in a paper on the diamond-bearing rocks of South Africa, said he had noticed that a peculiar odor, somewhat like camphor, was evolved upon treating the soft blue diamond earth with hot water. He powdered and digested a quantity of this earth with ether, and on filtering and allowing the ether to evaporate he obtained a small quantity of a crystalline, strongly aromatic, volatile body, burning easily with a smoky flame, melting at 50° C. The quantity obtained was too small to admit of a full investigation of its composition and properties. He suggested that perhaps the diamond was formed from a hydrocarbon simultaneously with this aromatic body. H. Carvill Lewis, in describing the genesis of the diamond, said that from the De Beers mine, at a depth of 600 feet, there had been sent him specimens of rock that were unaltered, and proved to be a peridotite containing carbona-

aceous shale; that from information he had received from New South Wales, Borneo, and Brazil, he believed that all diamonds were the result of the intrusion of a peridotite through carbonaceous rocks and coral seams.

Artificial Diamond.—In 1880 Mr. J. Ballantine Hannay claimed to have produced artificial diamonds by tightly sealing in steel and iron tubes or coils about 4 inches thick, made by boring out a solid block of iron, a mixture of 10 per cent. of bone oil and 90 per cent. paraffin spirit, and subjecting these tubes to intense heat for some hours. After 80 experiments he obtained 14 milligrammes of residue, part of which he called diamond. The substance was pronounced diamond by Profs. Maskelyne, Roscoe, Stokes, and others. In 1888 C. A. Parsons made a series of experiments on carbon at high temperatures and under great pressure, and with other substances for the purpose of producing a dense form of carbon for use in arc and incandescent lamps. The results proved unsatisfactory, but incidentally there was obtained on the surface of the carbon rod a gray powder harder than emery and capable of scratching the diamond, which he concluded was probably diamond itself. A full account of the experiments was given in a paper read before the Royal Society of London.

Ruby.—The Burmese ruby mines have cost the British Government a vast sum of money. During the wars of 1826 and 1852 England expended \$75,000,000 and \$15,000,000 respectively, and after this sacrifice the Burmah and Bombay Trading Company claimed that King Thebaw of Burmah had arbitrarily canceled the leases by which the company controlled the output of the ruby mines near Mandalay. The war of 1886 followed and involved the raising of an army of 80,000 men and an outlay of \$5,000,000, but the British Government gained control of the ruby mines. They are in the valley of the Mogok, about 75 miles north of Mandalay, at an altitude of 4,200 feet. Concerning them very little was known, as they were always the monopoly of the Crown and were jealously guarded. It was said that they paid King Thebaw's Government 100,000 rupees annually, and in one year 150,000 rupees. Mining is carried on there by about 50 wealthy natives, who employ the poorer townspeople at liberal wages. All the gems are sent to Ruby Hall, Mandalay, to be valued.

Artificial Ruby.—This subject is of importance not only commercially, but as illustrating the surprises that chemistry is constantly giving us. In 1886 the syndicate of dealers in precious stones in Paris were informed that certain stones, put upon the market by a Geneva house and sold as rubies from a new locality, were suspected to be artificial. It was surmised that they were obtained by the fusion of large numbers of small rubies, worth a few dollars a carat, into one fine gem valued at from \$1,000 to \$2,500 a carat. Some of these artificial stones were examined by George F. Kunz, who found that the principal distinguishing characteristic between them and genuine stones was the presence of spherical bubbles, with rounded ends, similar to those seen in glass or other fused mixtures. When examined individually they

seemed to be filled with gas or air that often formed part of a cloud, the rest having the waviness of a fused mixture. A few were observed inclosing inner bubbles, apparently a double cavity, but empty. In natural rubies the cavities are angular or crystalline in outline, and are usually filled with some liquid, or if they form part of a "feather," as it is called by the jewelers, they are often arranged with the lines of growth. Hence the difference in appearance between the cavities in the natural gem and those in the fused gem is very distinct, and can readily be detected by means of a pocket lens. No traces of anything like a crystalline or angular cavity were found in any of the artificial stones, and in many genuine rubies there is a flossy-looking structure, called "silk" by the jewelers, which, if examined under the microscope, is found to be a series of cuneiform or acicular, often iridescent, crystals, arranged parallel to the hexagonal layers. When in sufficient number these crystals produce the asteria or star effect common to the gem when cut "en cabochon," as the carbuncle or convex cut is called, with the center of the hexagonal prism on the top of the cabochon. This condition is absent from the artificial stones, as well as the marking of the hexagonal crystal, which can often be seen when the light is allowed to strike obliquely across the hexagonal prism. These artificial rubies were probably produced by a process similar to that described by Edmond Fremy and Feil in 1877. An aluminate of lead is used with silica in a siliceous crucible, the silica unites with the lead to form a lead glass, and the alumina crystallizes out in the form of corundum in hexagonal plates, with a specific gravity of 4.0 to 4.1, and the hardness and color of the natural ruby, the latter being produced by the addition of some chromium salt. By this method rubies were formed that, like the true gem, decolorized temporarily on heating. Gaudin's method for producing artificial gems consists in exposing amorphous alumina to the flame of the oxyhydrogen blowpipe, fusing it to a limpid fluid, which, when cooled, had the hardness of corundum, but the specific gravity only of 3.45. The French syndicate referred the matter to M. Friedel, of the School of Mines, Paris, and supplied him with samples of the stones for examination. He reported the presence of the round and pear-shaped bubbles and determined the hardness and specific gravity to be about the same as in the true ruby. The syndicate then decided that all cabochon or cut stones of this kind should be sold as artificial and not as precious gems. Unless consignments were so marked, the sales were to be considered fraudulent and the misdemeanor punishable under the penal code. All the sales that had been effected, amounting to 600,000 or 800,000 francs, were canceled, and the money and the stones were returned to their owners. Edmond Fremy has published the successful result of a second series of experiments to produce artificial rubies. By the former process the rubies obtained were defective, but by the new process perfect rubies 1 to 2 millimetres in size were produced, having the purity of the natural gem and scratching topaz. His method is to fuse fluoride of borax and aluminum containing bi-

chromate of potash that under the continuous action of fire for fifty hours yields a porous and friable gangue in the crucible containing rubies which were separated from it by washing.

Artificial Emeralds.—Hautefeuille and Perry, two French chemists, have succeeded in producing very beautiful crystals of emeralds by fusing silica, alumina, and glucina containing traces of oxide of chromium with the acid molybdate of lithia. The materials were heated to a temperature of 600° to 700° for fifteen days. There were obtained fifteen grammes of small crystals of about a millimetre, having all the mineralogical and physical characters of the natural emerald. The longer the operation is continued the larger the crystals become.

Sapphire.—In 1882 a very remarkable discovery of sapphire was made in the Zenskar range of the northwestern Kashmir Himalaya, a short distance from the village of Machel. The stones were found at the foot of a precipice, where a landslide had taken place, the including rocks being gneiss and mica. They were collected by the villagers, who were attracted by their beautiful colors, and so little was their value realized that they were used as flints for striking lights with steel. They were so abundant at first that one writer speaks of having seen about a hundredweight of them in the possession of a single native. The price rose rapidly until about £20 an ounce was paid for good specimens, at which rate they have remained. The Maharajah of Cashmere promptly sent a regiment of sepoy to take possession of the mines, and worry natives who were suspected of having gems in their possession or who had any knowledge of new localities where they could be found. Several crystals were found weighing from 100 to 300 carats each. During the first year of the discovery the Delhi jewelers are said to have bought more than £20,000 worth of these sapphires.

Pearls.—Pearls have never been so popular or commanded such high prices as in recent years. At present nothing is considered more desirable than the pearl, on account of its purity and subdued beauty. This unusual request has greatly stimulated the search for them, especially on the western coast of Australia, the Thursday island, the Sooloo Archipelago, in Ceylon, and the Persian Gulf, and also along the coast of Lower California. The demand includes pearls of all colors except the inferior yellow. Fine black pearls from Lower California have been in great request, single ones bringing as much as \$8,000. With these black pearls are found many beautiful gray and grayish-brown pearls. The different fisheries of the world produce \$1,000,000 worth annually, of which those in California yield about one sixth. Kentucky, Tennessee, and Texas have given us over \$10,000 worth of pearls a year; their remarkable fresh-water pearls, especially the pink ones, are unrivaled for delicacy of tint. Fancy-colored pearls have been colored by artificial means.

Opal.—When it became generally known that Queen Victoria was partial to the opal, the old and stubborn superstition concerning it slowly yielded until that gem has now its share of popular favor. Many of those imported are of the fine Hungarian variety. Mexican fire opals are

much more common, and come from mines on the Hacienda Esperanza, near Querearo. It is believed that a demand of 100,000 stones a year could be supplied without raising the price perceptibly. The opal mines of Dubreck, Hungary, yield the Government a revenue of \$6,000 annually. About fifteen years ago a new and very interesting variety of opal was brought from Baricoo river, Queensland, where it was found in a highly ferruginous jasperlike matrix, sometimes apparently as a nodule, and then again in brilliant colored patches or in specks affording a sharp contrast with the reddish-brown matrix, which admits of high polish and breaks with conchoidal fracture. Many of these stones are exceedingly brilliant. They are known as harlequin opals, and their color is somewhat yellow as compared with the Hungarian stone, although not less brilliant. The rich ultramarine blue opal is peculiar to this locality. A company capitalized at £200,000 was formed, and the gems are mined extensively. Many curious little cameolike objects are made by cutting the matrix and the opal together.

Fancy Stones.—The gem and mineralogical collections contain a large series of stones that are hard, of rich color, and are now known as "fancy stones," and by the French as *pierres de fantaisie*. Considerable interest has now centered in these fancy stones. The Duke of Connaught gave his bride a cat's-eye engagement ring, and this made that stone fashionable and increased its value. The demand soon extended to Ceylon, where the true chrysoberyl cat's-eye is found, and stimulated the search for it there. In the chrysoberyl cat's-eye the effect is the result of twinning of the crystal, or of a deposit between its crystalline layers of other minerals in microscopic inclusions. If the stone be cut across these layers, *en cabochon*, or carbuncle cut, a bright line of light will be condensed on the domelike top of the stone. In searching for these chrysoberyl cat's-eyes, there have been found a series of chrysoberyls of deep golden, light yellow, yellow green, sage green, dark green, yellowish brown, and other tints that weigh from 1 to 100 carats each, and rank next to the sapphire in hardness. It was found that the darker leaf-green or olive-green stones possessed the dichroitic property of changing to columbine red by artificial light, the green being entirely subdued and the red predominating. They were alexandrites, a gem that had formerly been found only in Siberia, and there of poor quality. A perfect gem of 1 carat was a rarity. Here, however, fine gems under 4 carats were common, and an exceptional one weighing 67 carats was found. Among this alexandrite variety a few have been found which include the characteristics of the cat's-eye, and hence were named the alexandrite cat's-eye. Moonstones from the province of Candy, Ceylon, were brought to light by this search for cat's-eyes. Probably 100,000 of these stones have been mounted in this country. They vary in size from one eighth of an inch to nearly two inches in length and one inch in thickness, and many of them surpass anything hitherto known of their kind in beauty and size. Those that display the chatoyant white and the hazy blue color are especially beautiful. The demand for cat's-

eye also brought into demand the rare mineral crocidolite from Orange river, South Africa, more especially the variety that has been altered to quartz cat's-eye. In this stone an infiltration of siliceous material coated each fiber with quartz or chalcedony, giving it the hardness of seven. This pleasing stone readily sold for \$6 a carat, but owing to excessive competition the price fell to 25 cents a pound in quantity. Table tops have been made of this material by veneering, also vases, cane heads, paper weights, seals, charms, and similar articles. Burning it produced a bronzelike luster, and by dissolving out the brown coloring an almost white substance was obtained, which was dyed by allowing it to absorb red, green, and brown solutions.

American Gems.—The handsomest and cheapest of our ornamental stones, and one that has been introduced extensively, is the so-called Mexican onyx, or Tecali, as it was first called from that town, in the State of Puebla, Mexico, where it occurs. The deep colors are richer than those of any marble known, and its wavy, stalagmitic structure and the high polish it takes made it popular throughout the world. With a metal mounting the effect is greatly enhanced. It occurs in almost unlimited quantities, and it has been largely used in the United States for table tops, mantels, and vases. The existence in Arizona of agatized and jasperized woods richer in color than any thus far discovered was known for many years, but general attention was first called to them by an exhibit at the New Orleans Exposition. This deposit is 8 miles south of Corriza, a station on the Atlantic and Pacific Railroad, 24 miles southeast of Holbrook, and has been appropriately named Chalcedony Park. Some of the trees were originally 200 feet in length, and many of them are broken into uniform sections, resembling a pile of car wheels in appearance, varying in diameter from a few inches to eight feet. The fracturing was evidently the result of weathering. The colors present various shades of yellow, red, brown, and white, sometimes in spots, giving a mottled appearance and again all blending to produce a more pleasing and harmonious effect than the decided banding of agate. The original structure is in many instances preserved, but generally it has been entirely replaced by the agate or jasper. One of the wonders of this park is a silicified tree, 100 feet in length and from 3 to 4 feet in diameter, that spans a gulch 55 feet in width and 45 feet in depth, forming a natural bridge of agate, the gulch having been washed out under the tree after its silicification. Although this material occurs here in immense quantities, only part of it is suitable for cutting. Very little attention had been paid to cutting masses of agate more than one foot in diameter, and when this stone began to be utilized for ornamental purposes the cutting seemed to present insurmountable difficulties. The Drake Company, of St. Paul, Minn., solved the problem and erected works at Sioux Falls, Dak., where they utilize the water power, and have succeeded in cutting and polishing sections of the material 3 feet in diameter. To illustrate the hardness of the material, it was found that the power used in sawing sections 2 feet in diameter would saw about 100 sections of Mexican onyx of the same

size, 50 sections of marble, and 10 of granite. It is used for mantels, table tops, tiling, paper weights, inkstands, and a variety of charms and other objects similar to those made from onyx.

The turquoise occurring at Los Cerillos, New Mexico, was worked by the natives before the arrival of the Spaniards, who also mined there. It is now cut by the Indians into flat beads or other ornaments, which are sold as charms. The color is not good, but these green stones have been artificially stained to a fair blue, and many of them have been sold as fine turquoises. The color has been tested with ammonia and found to dissolve readily, whereas the color of the Persian or the Egyptian turquoise is unaffected if left in ammonia for twenty-four hours. William P. Blake described a new locality of turquoise at Turquoise Mountain, in Cochise County, Arizona. The color is apple and pea green, exactly like that of the New Mexican stone. There were large piles of *débris* around the excavation, showing that it was worked before the country was inhabited by the Apaches. These turquoises, like those of the New Mexican locality, have little commercial value. Frank W. Clarke and Joseph S. Diller, of the United States Geological Survey, made a study both chemically and microscopically of the New Mexican turquoise, as well as the trachyte in which it occurs, and found that, with the exception of the very dark-green variety, the series of analyses agreed with those of Persian and Californian turquoises. V. von Zepharovich and Gideon E. Moore described and analyzed a turquoise from Taylor's Ranch, Fresno County, Cal., which has replaced crystals of apatite. A deposit has been found in the Holy Cross Mining District, Colorado. What may become of considerable use as an ornamental stone is the jasper found in Graham County, Kansas, which is banded like onyx in red, yellow, brown, white, and other colors. Pieces 1 foot long and 6 to 8 inches thick can be taken out.

The small brilliant rutile crystals from Alexander County, N. C., have furnished perfect black specimens which approach the black diamond more closely in appearance than any other known gem. The well-known labradorite rock in Lewis County, N. Y., is so plentiful that the reflection of the bowlders has given the stream that runs through the locality the name of Opalescent river. It is extensively cut as an ornamental stone. At Auburn, Me., hundreds of crystals of tourmaline have been found. Some of these have been cut into gems, though they do not rival those from the more famous locality at Paris, Me. In color they are generally light green, light blue, and light red. The Mount Mica Mining Company began operations at the famous tourmaline locality near Paris, Me., in 1870. They continued for three summers, and were rewarded by the discovery of some of the finest green, blue, and white tourmaline that ever have been found. A crystal of blue tourmaline measuring 9 inches in length and a green tourmaline that measured 10 inches were among the most remarkable finds, the proceeds of which altogether have amounted to more than \$5,000.

Green beryls, blue and green sapphires, white and bluish topaz, garnets, and zircons have been found in New England and in New South Wales,

and from the Abercrombie river some precious opals. An opaque variety of hydrophane, in rounded lumps, from 5 mm. to 25 mm. in diameter, with a white, chalky, or glazed coating somewhat resembling the cacholong from Washington County, Ga., has recently been brought from Colorado. When water is allowed to drop on the mineral it is slowly absorbed and at first becomes very white and chalky, and then gradually perfectly transparent. This property led the finder to propose the name "Magic Stone" for it, and he suggested its use in rings, locketts, and charms to conceal photographs or other objects which the wearer wishes to display only as caprice dictates. The specific gravity of several specimens, both wet and dry, was taken, and it was found that it absorbs more than an equal volume of water. This stone is identical with one brought from China several centuries ago, and described as the "oculus mundi," or "world's eye," and as the "lapis mutabilis," which when wet became entirely transparent except a central nucleus (possibly a core of chalcedony). If the central core was black, the stone was called "oculus beli." In 1882 topaz was first discovered in Colorado, and since then it has been found in some abundance at Platte mountain, Cheyenne, and at Crystal Peak, near Pike's Peak. Many of the crystals are very large, several of them weighing over a pound each. The smaller ones are transparent and range in color from pellucid white to rich cinnamon brown; a few are light blue and light green. The two largest gems weighed 125 and 193 carats respectively, and equaled those from any known locality. At Stoneham, Me., while examining minerals collected by Nathaniel H. Perry, topaz was identified, including several crystals measuring one foot on the face, also a number of smaller ones some of which had small transparent spots that afforded a limited number of gems of several carats each. Five years ago the existence of rock crystal of any size was almost unknown in the United States, but about that time a large clear mass, weighing some 13 pounds, found in Alaska, was brought to New York city and made into thin slabs for hand mirrors. In 1885 a 51-pound fragment, said to have been broken from a crystal that originally weighed 300 pounds, was found on Chestnut Hill Township, Ashe County, N. C. Most of the crystals in that vicinity were obtained either by digging where one crystal had been found or by driving a plow until it unearthed them. Several dozen in all have been found there, one mass of 20 pounds being almost absolutely pure. Some of them would afford larger masses of clearer rock crystal than any that has before been obtained at an American locality. It is used for crystal balls, clock cases, hand mirrors, and similar objects. In 1887 F. Pisani, of Paris, described a transparent golden-yellow spodumene from Brazil that was supposed to be chrysoberyl. About the same time a yellow-green variety associated with emerald-tinted beryl crystals, the latter called "green bolts" by the farmers, was obtained by J. A. D. Stephenson, of Statesville, N. C., who called the attention of the Northern mineralogists Norman Spang, Frederick A. Genth, and William E. Hidden to it. The latter formed a company to mine the emeralds, and sent a speci-

men of it, which he supposed to be diopside, a variety of hornblende, to J. Lawrence Smith, of Louisville, Ky., who found upon analysis that it was a transparent spodumene instead of diopside, as had been supposed, and named it Hiddenite. This locality has furnished many of the finest emerald crystals that have ever been found, including one 8 inches long and another weighing 8½ ounces, valued at \$1,000. Both of these, together with many other fine minerals found here, are in the Clarence S. Bement cabinet, Philadelphia, the finest private collection of minerals in existence. One light emerald furnished a gem of 5½ carats, but this, as all found there, was too light in color to be of much value. In 1883 one half of a fine blue crystal of beryl was found near Stoneham, Oxford County, Me. It led to a search in which the remaining half and a number of other crystals were found, from one of which was cut the finest aquamarine on this continent, weighing 120 carats, as well as many other fine stones, weighing several hundreds of carats in all. Fine transparent yellow beryls have been found at Albany, Me.; at Avondale quarries, in Delaware County, several 20-carat stones and many smaller ones have been found; and at a mica mine near Litchfield, Conn., several thousand dollars' worth of this gem have been obtained. Amelia County, Va., and several localities in North Carolina have afforded good specimens. At Mount Antero, Colorado, at an altitude of 12,000 to 14,000 feet, beautiful beryls of good blue and green color associated with phenacite have been found that have furnished a number of gems of from 6 to 10 carats each. This locality is covered with snow nearly the entire year. Robert B. Riggs, of the United States Geological Survey, has made over 25 analyses of tourmalines of all colors. He found the color of the iron and magnesian varieties dependent on the amount of iron present. The shades of color depend on the ratios existing between the manganese and the iron. Thus when the amount of manganese and iron are equal, we have the colorless, pink, or very pale green tourmaline. An excess of manganese produces the red varieties; and if the iron is in excess the various shades of green and blue result, as is practically illustrated in glass manufacture.

Jade.—In recent years the taste for collecting jade and other carved hard-stone objects has greatly increased, especially among Americans, owing to the breaking up by sale of many large collections. The value of carved jades outside of China and India can not be far from \$2,000,000. In the United States there are perhaps 20 buyers, who have purchased \$500,000 worth of this material, many of the pieces being among the finest known, such as the private seal and other objects from the sacking of the Emperor of China's summer palace. The finest pieces brought over by Tienpau included some of the best pieces that ever left China, and were intended for the Amsterdam Exhibition. The choicest specimens of the Wells, Guthrie, Michael, and Hamilton Palace collections are now owned in the United States. Experienced agents have been frequently sent to India and China to secure fine objects as they presented themselves. One collection alone could not be duplicated for over \$200,000, single objects sometimes selling

for over \$5,000, and one exceptionally fine specimen being estimated at over \$10,000. Explorations in Alaska have brought to light the fact that jade was used by the natives of Alaska for implements, and it is almost proved that it is found not only as bowlders, but also *in situ*. The National Museum, the Emmons, Everett, Peabody Museum, Canadian Geological Survey, Dresden, and other collections contain several hundred objects made of this Alaskan material. Frank W. Clarke found among the objects collected for the United States National Museum one which resembled pectolite so closely that he referred it to that species. It had the hardness of jade, a specific gravity of 2.873, and was pale green in color. The theory that jadeite or chalchihuitl was highly prized by the aborigines has been greatly strengthened during the last ten years. J. J. Valentine, in a paper before the American Antiquarian Society, in 1881, on the Humboldt celt or votive adze, and the Leyden plate, two remarkable carved jadeites, offered some exceedingly interesting suggestions. The Humboldt celt was presented to Humboldt by Del Rio in 1803, and the Leyden plate was given to the Leyden Museum by S. A. von Bramm, who found it near St. Felipe close to the borders of Guatemala, in Honduras. They are both 9 inches in length and 3½ inches wide, the former 1½ inch in thickness, and the latter only ¼ inch. This similarity of measurements suggests that the two objects were originally part of one and the same celt. In April, 1886, Frederick W. Putnam exhibited before the same society his remarkable series of Nicaragua and Costa Rica jadeites, which ornaments were made by cutting into halves, thirds, or quarters one large celt perforated by one or two drilled holes, in one instance two of them fitting together. The 16-pound adze exhibited by George F. Kunz at the meeting of the American Association for the Advancement of Science in 1887, from which fully 2 pounds had been cut, and the breastplate recently found, measuring only ¼ inch thickness, together with the fact that even Burmese jadeite when burned or exposed to a high temperature will assume the grayish-green color of the Mexican, all tend to support Prof. Fisher's theory that this jadeite originally came from there. Additional evidence is the striking resemblance between the Maya and ancient Burmese styles of carving, although Dr. Adolph B. Meyer, of Dresden, firmly believed that this material will yet be found *in situ* in Mexico. The existence of beads of this material the necklaces made of common stones suggests its similar origin. The imperial jade quarries of Burmah, in the Moging district, 90 miles from Bhamo, are leased by two companies, who pay a royalty of \$30,000 annually. At the Colonial Exhibition held in London in 1886 there were exhibited large rounded and water-worn blocks of jade weighing hundreds of pounds, called by the Maoris panau. Much of it was of the finest green color, and was worked into charms and similar objects.

PRESBYTERIANS. I. Presbyterian Church in the United States of America.—The following is the general summary of the statistics of this Church for 1898, besides which are given, for comparison, the statistics of 1888 and 1891:

ITEMS.	1888.	1891.	1893.
Synods.....	28	80	81
Presbyteries.....	202	216	221
Candidates.....	997	1,817	1,900

The General Assembly met in Washington, D. C., May 8. The Rev. Willis G. Craig, D. D., of McCormick Theological Seminary, was chosen moderator. The Committee on Theological Seminaries presented a report concerning the relations of the Assembly to its seminaries. The report concerned the present legal status of the seminaries and the present control of the Church over them. It reviewed the history of each of the fourteen seminaries, beginning with Princeton, the oldest, in the formation of which it was the purpose of the Church to maintain direct and complete control by the Assembly of the teachings and property. As the Church grew in numbers, other seminaries and schools were formed, some of them, as the Western, McCormick, Danville, and Omaha, substantially on the same plan as Princeton.

Other seminaries, organized under different plans, have become connected with the Church, either by contract relations or through the action of their boards in seeking the indorsement of the Church in order to obtain funds and students. Union and Lane are typical of two classes, Auburn and San Francisco of two others. Union is a civil corporation, whose charter is undenominational, and makes no reference of any kind to the Presbyterian Church. No control of the seminary, either in its teaching or property, is, by the terms of its charter, given to the Church in any of its agencies. In the case of Lane, the only reference to the Church in the charter is in Article III, which provides that a majority of the Executive Committee and all of its professors and instructors shall be members of the Presbyterian Church in good standing. While these seminaries (Union and Lane) have been regarded as in connection with the Presbyterian Church, and have heretofore been operated in the interest of that denomination, by the terms of the charters of the respective corporations, which have absolute control of the property, subject only to such terms and conditions as the donors impose, the Presbyterian Church has no control of any kind over the teaching or the property of these seminaries, and can afford the donors of funds to them no protection in the matter of applying their gifts to the purposes for which they are made. Auburn is controlled by certain presbyteries and San Francisco by certain synods. The charters of the independent

synods holding the property in trust for the seminaries differ more or less in detail, but have this common feature: that these corporations own the property and have its control and management, free from any direct interference by the General Assembly, save as to the property given them by the Assembly, as to which the Assembly may direct the management. While it is claimed that the power of the Assembly, under the compact of 1870, and the plan of reunion over the various theological seminaries is limited to the exercise of the right of approval, or veto, of the appointment of professors and the prerogative of receiving annual reports from the seminaries, "according to the plan of government of Princeton, Western, McCormick, Danville, and Omaha, the General Assembly has the right to control the election of boards of directors."

The Committee on Church Unity reported concerning the results of an oral conference held at Baltimore with the members of the Episcopal Commission in attendance upon the Triennial Protestant Episcopal General Convention. The "unhappy attitude" in which the two Churches often stood toward each other, "with almost entire isolation, almost entire absence of all that personal intercourse and mutual recognition, Christian fellowship, and hearty co-operation which ought to obtain between them as brethren in Christ," was discussed. Christian unity, a unity of spirit, the committee held, "must precede and prepare the way for all church unity, and is in itself a duty of present and imperative obligation. An external union, even if it were practicable, were worse than worthless if it was not the outgrowth and manifestation of a real inward spiritual union." The committees had therefore agreed to hold in abeyance for the present the question of an external union, and to seek, first, as a necessary prerequisite to it, and in itself as a present and imperative duty, a larger measure and manifestation of Christian unity.

A correspondence with the Protestant Episcopal Commission was inclosed, in one of the letters, of which the commission declared that,

according to our understanding, our [the Protestant Episcopal] Church in America to-day stands with the authority of the presbytery fully recognized, and with it, standing in its relative position of control of legislation, precisely as the English Presbyterians of 1660 caused it to stand in the Church of England when they professed that they would be content with the Anglican Episcopate, provided such and such authority was secured to the body of the presbytery.

The Presbyterian Committee replied that this, with other expressions of the Episcopal commission, and its declaration of its readiness to modify some things in its position, if necessary, for the sake of union, induced the hope that closer co-operation between the two bodies might be brought out in the near future. The Assembly, in its action upon this report, recognized "the growing conformity between the politics of the Episcopal and Presbyterian Churches," and expressed its readiness to co-operate with the General Convention of the Protestant Episcopal Church in all Scriptural measures for the promotion of closer fellowship between the two Churches. "Especially would it delight in ministerial reciprocity under regulations satisfactory to both parties." It recommended the holding of conventions according to the terms

which had been proposed by the Episcopal Commission for the promotion of Christian unity.

The same committee reported a plan for federal union between the Reformed Churches in the United States holding to the Presbyterian system. The plan contemplated the preservation of the independence and autonomy of the bodies entering into the federation and the giving of full credit to all their acts, but provided for the constitution, for the prosecution of work that can be better done in union than separately, of an ecclesiastical assembly, to be known as "the Federal Council of the Reformed Churches of the United States of America holding to the Presbyterian system." This Federal Council, it was contemplated, should endeavor to promote united work for the reclamation of the Christless masses in the large cities, towns, and old rural settlements of the country; co-operation in home missionary work by the different denominations in the new settlements and among the freedmen of the South in such a way as to remove denominational friction, etc.; and the prosecution of foreign mission work on the same principle of comity, so that different denominations shall cultivate different fields; should keep watch of current movements, and take such action as may concentrate the union of all the churches for the maintenance of their principles and interests; should have power to "advise and recommend in all matters pertaining to the general welfare of the Kingdom of Christ, but shall not exercise authority, except such as is conferred upon it by this instrument, or such as may be conferred upon it by the federated bodies. It shall not interfere with the creed, government, or worship of the denominations. All matters of discipline shall be left to the exclusive and final judgment of the ecclesiastical authorities of the denomination in which the same may arise." The Federal Council shall "have the power of opening and maintaining a friendly correspondence with the highest assemblies of other religious denominations, for the purpose of promoting union and concert of action in general or common interests."

The Committee on Co-operation in Home Missionary Work reported concerning the action which had been taken by the Board of Home Missions to insure caution in the organization of mission churches—encouraging such only as are likely to become in time self-supporting—and concerning its conference with representatives of the Home Mission Board, the American Home Missionary Society, and the Board of Domestic Missions of the Reformed Church in America. It was found that the rules of the various societies already in force were sufficient for the purpose. The committee in the judicial case of Prof. Charles A. Briggs (see "Annual Cyclopædia" for 1892) presented a report affirming the pertinency of the appeal from the prosecuting committee of the Presbytery of New York from the decision of the presbytery acquitting Prof. Briggs of the charge of heresy brought against him. The report declared that

The appellant in this case was the Church itself represented by the prosecuting committee, and as such it had a right of appeal as an original party; and that the prosecuting committee of the presby-

tery had a right to prosecute the case to a conclusion; and that the appeal was in order, and therefore recommended that the appeal be entertained and the case issued.

In a supplementary statement accompanying the report the Book of Discipline (chap. ix, sec. 4, par. 102, and chap. xii, sec. 4) was cited to show that an appeal directly from the presbytery to the General Assembly was provided for and in order, and the observation was added, as bearing upon the passing over the synod to take the case to the Assembly, that "it is eminently desirable that the Assembly making such decision should, as far as practicable, be representative of the entire Church. Should these views be decided on appeal from the Synod of New York, the commissioners from that synod, representing more than one fifth of the entire membership of the Church, would be debarred by section 98 of the Book of Discipline from sitting, deliberating, or voting in the case. Moreover, such a case of exclusion of the Synod of New York might work to the disadvantage of the defendant himself. As far as the defendant himself in this case is concerned, it is manifestly more just that the Assembly, which finally passes upon his case, should not be compelled to exclude his own synod, the Synod of New York."

The Assembly decided by a vote of 410 to 145 to entertain the appeal. A formal judgment was then entered declaring Prof. Briggs guilty of teaching the errors mentioned in the charges which had been sustained, and of violation of his ordination vows, and suspending him from the office of a minister of the Presbyterian Church until he shall give satisfactory evidence to the General Assembly of repentance of his offenses. The committee to whom had been intrusted the duty of formulating a deliverance of the Assembly on the doctrinal points involved in the appeal reported that they found "that the doctrine of the errancy of Scripture as it came from them to whom and through whom God originally communicated his revelation, is in conflict with the statements of the Holy Scripture itself . . . and also with the statements of the standards of the Church"; that involved in the case was the question of the sufficiency of the human reason and of the Church as authorized guides in the matter of salvation. A recommendation was further made that the Assembly declare that the reason and the Church are not to be regarded as fountains of divine authority; that they are unreliable and variable, and while they may be, and no doubt are, channels or media through which the Holy Spirit may reach and influence for good the human soul, they are not to be relied upon as sufficient in themselves and aside from Holy Scripture to lead the soul to a saving knowledge of God; and that involved in Prof. Briggs's views was a speculation in regard to the process of the soul's sanctification after death, which, in the judgment of the Assembly, was a dangerous hypothesis, in direct conflict with the plain teachings of the Divine Word and the utterances of the standards of the Church.

A protest was entered against the judgment of the Assembly, as involving, in the opinion of the protestants, acts of doubtful constitutionality; as seeming to abridge the liberty of opinion

hitherto enjoyed under the standards by the office bearers in the Church; as tending to the discouragement of the thorough study of the Bible and reverent advance in apprehension of divine truth; and as inflicting an injustice on a Christian scholar of acknowledged high character as well as on the Presbytery of New York,

CHARLES A. BRIGGS.

which had fully acquitted him of the charges alleged against him. The committee appointed by the preceding General Assembly to arbitrate with the directors of Union Theological Seminary reported concerning the proceedings it had taken and the correspondence it had begun with the directors, when all action was concluded by the resolution of the Board of Directors rescinding the resolution of 1870, by which the compact with the General Assembly was adopted. On the recommendation of the committee, the Board of Education was enjoined to give aid to such students only as may be in attendance upon seminaries approved by the Assembly.

A committee appointed by the previous General Assembly on a model constitution for young people's societies reported adversely to the adoption of a uniform constitution.

The following paper was adopted declaring the doctrine of the inspiration of the Scriptures:

The General Assembly reaffirms the doctrine of the deliverance of the Assembly of 1892, touching the inspiration of Holy Scriptures—viz., that the original Scriptures of the Old and New Testaments, being immediately inspired of God, were without error, and in so doing declares that the said deliverance enunciates no new doctrine and imposes no new test of orthodoxy, but interprets and gives expression to what has always been the belief of the Church, taught in the Westminster Confession of Faith.

A protest was entered against this declaration, because it insisted upon a certain theory of

inspiration when the standards had hitherto only emphasized the fact of inspiration; because it was dogmatizing on a matter of which we necessarily have no knowledge; because it was insisting on an interpretation of the standards which they had never borne, and which on their face was impossible; because it was setting up an imaginary Bible as a test of orthodoxy; because it was disparaging to the Bible we have and endangering its authority under the pressure of a prevalent hostile criticism. An answer was prepared to be spread on the minutes, together with the protest affirming that the declaration imposed no new test of orthodoxy and set forth no new theory of inspiration, but only reaffirmed certain statements in the Confession of Faith and the Larger Catechism; and a resolution was also recorded declaring that the Bible as we now have it, in its various translations and versions, when freed from all errors and mistakes of translators, copyists, and printers, is the very Word of God, and consequently without error.

After Proceedings in the Case of Prof. Briggs.—After the adjournment of the General Assembly, Prof. Briggs published a letter charging the responsibility for the action of that body upon "the reactionary theologians of the school of Breckinridge," who, he said, had "exhausted their power in suspending one man from the ministry and in making new definitions of dogma and new precedents of law," and indicating, on the assumption that a minority of the Church had violated the constitution, what, in his opinion, liberal Presbyterians should do under the circumstances. The lines of battle, he said,

should be (1) legal and (2) doctrinal. The legal lines are those for which the appellee contended—(a) that there should be no appeal by a public prosecutor against a verdict of acquittal; (b) that a presbytery can not appoint a committee of prosecution which will be independent of the presbytery; and (c) that the jurisdiction of the synod can not be taken from it at the pleasure of the General Assembly. The doctrinal lines are: (a) That Holy Scripture is the only infallible rule of faith and practice; (b) that a minister is bound only to the system of doctrine contained in the Westminster Confession; (c) that the General Assembly can not make new definitions of dogma, either by deliverance or by a final judgment in a heresy trial.

Having advised action by presbyteries and individuals for asserting and vindicating the constitutional rights of the presbyteries, the writer continued:

The Presbyterian Church is a constitutional church, which has in its form of government a prescribed course of procedure for amendments of its definitions of faith and of law. If a General Assembly by a majority vote make new law and new doctrine, it makes them by unconstitutional procedure, which no minister or layman is under obligation to obey, but which he is under bonds to resist to the utmost as illegal and revolutionary. Therefore no minister or layman should feel under any obligation to retire from the Presbyterian Church on account of the illegal acts of the late General Assembly. Every true Presbyterian should rather be challenged to defend the constitution against those who have trampled it under foot.

The appeal of Prof. Briggs to the Synod of New York against the action of the presbytery

was heard in October. It embraced five complaints, of which one related to the status of the prosecuting committee; two were based on the refusal of the presbytery to sustain objections to the amended charges; a fourth was based on the refusal to strike out the concluding paragraph of the amended charges; and the fifth on the action of the presbytery declaring the evidence offered by the prosecution competent. The synod dismissed all the complaint, alleging as its reason that the merits of the case had been heard on appeal, and a final judgment given by the General Assembly covering the whole case. The committee added: "This, in our opinion, clearly and finally disposes of all interlocutory questions in those cases, no matter when the cases were pending."

The Case of Prof. Smith.—Besides the condemnation of Union Seminary for retaining Prof. Briggs, the report on theological seminaries contained the following with reference to Lane Theological Seminary:

In the list of professors the Assembly finds the name of Rev. Henry P. Smith, D. D., who was in December last suspended by the Presbytery of Cincinnati for unsoundness in the faith. On Jan. 31, 1893, Prof. Smith tendered his resignation to the board because of that suspension. The board declined to receive such resignation, but continued him by formal action in the duties of his professorship in the seminary.

Where a minister is suspended, he is suspended from all the functions of his office. Among the most important of such functions is that of training young men for the ministry. However serious the embarrassment to the seminary, the board should have immediately accepted the resignation of Prof. Smith, or at least relieved him from the discharge of his duties. Loyalty to the Church should have compelled them to take such action with reference to the seminary. Its charter requires that all the professors shall be members of the Presbyterian Church in good standing. The Assembly, therefore, is constrained to withhold its approval and commendation of Lane Seminary until the board has reconsidered its action in this respect and remedied the error.

The Board of Trustees of the Seminary, after receiving this action of the General Assembly, adopted a protest against the Assembly's assuming the right to review and censure the proceedings of the trustees of the seminary in the administration of its internal affairs. No such power, the board asserted, had ever been conferred upon the Assembly, nor had the attempt ever been made heretofore to exercise it.

But if the board [the protest continues] feels constrained to put on its record its protest against the assumption of power by the Assembly, for which it can show no warrant, much more does it feel compelled, for the protection of its chartered rights and its own self-respect, to protest against the quasi-judicial proceedings of the Assembly in passing under review the alleged proceedings of the board without having its records before it, basing its censure avowedly on *ex parte* information gathered from sources other than official, and which the proceedings of the board show to be incorrect.

The board must further protest against the act of the Assembly by which it summarily, with no conference with the board or notice of its intent, cut Lane Seminary off from the approval of the Assembly, and its students from the aid of the Board of Education, so rendering the continuance of its work difficult, almost to impossibility. By this act the Assembly has of its own motion withdrawn from the

compact of 1870, by its withdrawal of the consideration on its part on which the compact of 1870 was entered into—viz, its recognition and approval of a seminary for instruction in theology, thus discrediting the same before the Church. In view of the above facts the Board of Trustees of Lane Theological Seminary regards itself as freed by the Assembly's action from any and all obligations growing out of our agreement of Aug. 28, 1870, until there shall be established such relations between the General Assembly and Lane Seminary as shall be satisfactory to the Church and consistent with the charter of the seminary and the rights and duties of its board of trustees thereunder. And it is the earnest desire and hope of this board that such satisfactory relations may soon be established.

This board affirms what its records attest, that it has always been faithful to its agreement of 1870, and true and loyal to the Presbyterian Church, and desires to continue and maintain its historic position.

With respect to Prof. Smith the board resolved:

Whereas, The General Assembly has declared that sentence of suspension from the ministry carries with it a suspension of the exercise of teaching in the theological seminaries; and

Whereas, Loyal acquiescence in the said declaration by our board seems to make it necessary that pending his appeal Dr. Smith should not teach in the seminary; and

Whereas, The board declined to receive his resignation when offered under censure, on the ground that such resignation would seriously prejudice his case before the synod and General Assembly; therefore,

Resolved, That Dr. Smith be requested to continue his present relation with the seminary during the coming year, with the understanding that he shall be relieved from teaching in the seminary until such time as final action in his case shall be determined, and that the action of the board last May to the effect that Prof. Smith continue teaching be rescinded.

Thereupon Prof. Smith peremptorily resigned his professorship.

The appeal of Prof. Smith from the decision of the Presbytery of Cincinnati suspending him from the ministry and from his offices was heard by the Synod of Ohio in October. Twelve points of complaint were made:

(1) That the Court erred in allowing members of the presbytery to sit in judgment on the case after they had published opinions of his guilt; (2) that the proceedings were irregular; (3) that the action of the presbytery failed to show that his teaching was contrary to fundamental doctrines; (4) that it was not definite and specific in that it did not define the sense in which the term inspiration was used; (5) irregularity in the statement of charges and specifications, some being founded on a mere inference of the prosecution; (6) declining to receive the whole of certain testimony, a part of which had been accepted; (7) allowing the vote of a member to be recorded and counted in his absence; (8, 9, 10) error in sustaining charges; (11) that certain specifications were grossly exaggerated, others not relevant; (12) that the imposed penalty is excessive, even if the professor were guilty.

The action of the presbytery on all these points was sustained, and the suspension of the appellant was confirmed. Prof. Smith decided to appeal to the General Assembly.

Committee on Theological Seminaries.—The General Assembly's special committee of fifteen appointed to prepare and report a plan of control of the theological seminaries which will secure closer relations between the Assembly and

these institutions met in Pittsburg, Pa., in December, and adjourned after three days spent in discussion without completing a report.

Conference of "Liberal Presbyterians."—A conference of "Liberal Presbyterians" was held in Cleveland, Ohio, in November. The sessions were private, but on adjournment, Nov. 10, the following declaration of principles was given out:

We, the undersigned, ministers and elders of the Presbyterian Church in the United States of America, being seriously concerned in view of certain facts and tendencies in our Church, hereby make the following statement:

1. We believe that the General Assembly has no right to impose upon the Church new doctrinal statements under the guise of interpretation, whether by deliverance or through judicial process, and, further, that interpretation of doctrine by the courts of the Church ought always to be strictly within the letter of the standards and with sacred regard to the broad and general terms of the reunion of 1870.

2. We believe that the most scrupulous care should be used in all trials for doctrinal divergence from the standards, especially now when a large majority of the presbyteries have expressed, after much deliberation, their dissatisfaction with our Confession of Faith as it stands, their desire for its revision, and many of them their desire for a new creed. We view with grave concern procedures at such a time, conducted by what seems to us interpretations of our standards strained beyond their letter and far beyond any just regard for the compact of the reunion.

3. We believe that no court of our Church has a right by deliverance, or resolution, or rebuke, or otherwise to seek to suppress respectful action by judicatories below it expressive of their anxiety and apprehension concerning anything in the Church which seems to them to imperil the constitutional liberties of the Church or of any of its members. The right of petition and remonstrance must not be denied in the Church of Christ.

4. We believe that the interpretation of one or two phrases in our Book of Discipline as meaning that a prosecuting committee should become from the moment it enters on its work independent of the court which appointed it, capable of living on even after the judicatory has died and of prosecuting after the judicatory has acquitted, is a strained interpretation, leading logically to many absurdities and easily to possible miscarriages of justice. If these phrases are fairly susceptible of such interpretation, they ought to be eliminated from the book.

5. We believe that it is no part of the constitutional power of any court of the Church to warn honest and God-fearing men to withdraw themselves from its ministry or eldership because they can not accept as binding upon them interpretations of doctrines which are outside the letter of the Confession and which have never been settled by the sanction of the presbyteries in any legal way. This method of discipline by withdrawal, enjoined by resolution of a church court, is not provided for in the Book of Discipline. Such warning carries no obligation of obedience.

6. We believe that our Church is broad enough and strong enough to abide by the spirit of the compact of reunion and to embrace in its communion and its ministry all forms and schools of reverent scholarship which accept the essential and necessary articles of our common faith, acknowledging the Lord Jesus as Divine Master and Saviour and the Bible as the only infallible rule of faith and practice.

7. We call upon all Presbyterians to stand together in defense of reasonable liberty of opinion in the Church and of the constitutional rights of individual members wherever assailed, and we heartily approve of the protest of Dr. Herriek Johnson, Dr. Niccola, and others at the last General Assembly.

8. We do most urgently counsel our brethren who may be perplexed concerning their duty to abide in

the communion and service of the Church, assured that in so doing they remain well within their constitutional rights.

Finally, only a profound sense of the peril that now besets our Church has led us to make this declaration of what seems to us fundamental principles.

II. Presbyterian Church in the United States.—The following is the summary of the statistics of this Church as reported to the General Assembly in May, 1893. The summaries for 1891 and 1892 are also given for comparison:

ITEMS.	1891.	1892.	1893.
Synods.....	18	18	18
Presbyteries.....	71	72	72
Candidates.....	371	409	427
Licentiates.....	66	64	74
Ministers.....	1,136	1,239	1,271
Churches.....	2,452	2,572	2,652
Churches organized.....	81	92	82
Churches dissolved.....	19	21	10
Ruling elders.....	7,679	7,659	8,099
Deacons.....	5,863	6,128	6,335
Added on examination.....	11,024	11,224	12,187
Total communicants.....	174,068	182,516	183,546
Adults baptized.....	8,359	8,385	4,226
Infants baptized.....	5,900	5,025	5,364
Baptized noncommunicants.....	85,968	85,905	87,275
Teachers in Sunday schools.....	18,972	16,271	16,647
Scholars in Sunday schools.....	117,419	115,852	119,754
<i>Contributions:</i>			
Sustentation.....	\$57,572	\$47,011	\$45,763
Evangelistic.....	75,778	90,189	64,186
Invalid fund.....	15,898	15,435	14,181
Foreign missions.....	106,868	118,442	120,954
Education.....	44,774	47,937	58,587

Congregational.....	619,278	697,876	621,793
Miscellaneous.....	114,590	117,490	124,776
Total.....	\$1,817,835	\$1,921,680	\$1,942,580

The Executive Committee on Home Missions reported to the General Assembly that the whole amount of funds in its hands during the year had been \$86,865, of which the treasurer had disbursed \$77,649. Thirty-four churches had been aided from the Church Erection and Loan fund, and 36 white congregations from the regular Loan fund; 237 ministers and licentiates ministering to weak congregations had been assisted from the Sustentation fund; 9 ministers and 3 teachers among the Indians, and 44 ministers engaged in evangelistic work had been aided from the Evangelistic and Indian Missions fund; and 145 names were enrolled of beneficiaries of the Invalid fund.

The Committee of Colored Evangelization reported that its receipts for the year from all sources had been \$10,189, an increase of 15 per cent. over the previous year. Work was done in all the Southern States except West Virginia and Arkansas. Two colored evangelists had been employed. Thirty-three ministers and licentiates had been aided in supplying 69 churches. Three schools had been conducted, in which colored children were taught daily in the Bible, the Catechism, and other branches. Tuscaloosa Institute for the education of colored ministers had gone on without interruption and successfully. The committee, owing to a misunderstanding of the action of the last Assembly, had not succeeded in arranging a confer-

ence with the Northern Church on co-operation. Another conference was asked for on propositions to unite the work of the Church in behalf of the negro in an effort to build up an independent negro Presbyterian Church; or, failing to agree upon this, to bring the work of the two churches in this cause into closer sympathy by practical co-operation in every way possible. The colored work at present embraced 43 ministers, 4 licentiates, 18 candidates, 67 churches, 1,682 members, and 1,760 pupils in Sabbath schools; 214 members had been added to the churches during the year, and \$2,205 had been contributed by the churches.

The receipts from all sources for foreign missions had been \$127,811. Nineteen missionaries had been added to the force in the field, 7 of whom went out to open a mission in Corea, and 30 candidates were before the Executive Committee ready to go. Against these the force in the field had been reduced by the death of several missionaries and the retirement of others. The missionaries in the Grecian countries had all been withdrawn, and the work there was left entirely in the hands of the native Church.

The General Assembly met in Macon, Ga., May 18. Judge J. W. Lapsley, of Montgomery, Ala., was chosen moderator, this being the first time in the history of the Church that a layman had been elected to that position. The committee appointed by the previous General Assembly to call a convention of colored Presbyterian ministers and churches with a view to organizing an independent colored synod reported that the commissioner with whom it was acting had visited and corresponded with the colored brethren very fully, and had ascertained that they were not yet prepared for that step; hence the convention had not been called, and there had been no meeting of the committee. A plan was approved for the organization and operation of a home and school for the orphans of ministers and the children of foreign missionaries who have to be sent home for education. A report of a committee which had been appointed to consider the subject of young people's societies was ordered published, and majority and minority reports on the same of a special committee of the General Assembly were referred to a special committee to report to the next Assembly. The report on the theological seminaries declared that "the orthodoxy and diligence and fidelity of those who teach and those who are taught, the unbroken harmony in the boards of directors, and the healthful pecuniary condition of each institution are occasions of great thanksgiving to the God of our fathers." The Assembly recommended that in selecting professors for the several theological seminaries due regard should be had for the best interests of the other seminaries. The "Narrative of the State of Religion" represented that in the matter of Sabbath observance there was not cause for congratulation. "Public opinion is lax, and the influence of public opinion is being felt by our people; . . . evangelical Christianity does not present an unbroken opposition to Sabbath desecration, nor do our own people. The number of our people who encourage the Sunday mail, Sunday travel, and the Sunday newspaper is appalling." The Assembly resolved that having in a former deliverance

condemned in most unequivocal terms the publication and reading of Sunday newspapers, and having earnestly advised all its people not to read newspapers publishing Sunday editions, it reaffirmed the former deliverance. The Assembly declared that while the usage of the Church was to grant letters of dismission to members in good and regular standing to churches not connected with the Assembly, such letters could not be demanded as a matter of right. An *ad interim* committee was appointed to consider and report to the next General Assembly concerning the advisability of making such changes in the requirements for licensure as may be necessary to correct what seemed to be a growing irregularity (in presbyteries permitting candidates to try their gifts in preaching before licensure). A deliverance formerly adopted was reiterated—that, in the opinion of the Assembly, the Scriptural wine to be used in the Lord's Supper is the fermented grape juice. The Assembly addressed a request to Congress to repeal the "Geary Chinese Exclusion act," because "it is fraught with great danger to the interest and lives of Chinese Christians in America, and of American Christians and missionaries in China."

On the subject of dancing the Assembly advised the sessions to proceed in the case of members indulging in the amusement by faithful and affectionate instruction from the pulpit, as well as in private by admonition and other suitable measures; "but, when all other means fail, then . . . to such methods of discipline as shall separate from the Church those who love the world and practice conformity thereto rather than to the law of Christ." It further enjoined "the absolute necessity of enforcing 'the discipline provided by our constitution against offenses,' under the word offenses including attendance by members upon theatrical exhibitions and performances and promiscuous dancing."

III. United Presbyterian Church in North America.—The following is a summary of the statistics of this Church as they were reported to the General Assembly in May, 1898: Number of synods, 10; of presbyteries, 62; of ministers, 805; of congregations, 985; of pastoral charges, 759; of members, 111,119; of Sabbath schools, 1,116, with 11,115 officers and teachers and 96,908 pupils; of young people's societies, 654, with 28,092 members. Number of ministers ordained during the year, 32; of members received on profession, 7,174; of baptisms, 1,518 of adults and 3,911 of infants. Number of mission stations, 207, of which 38 were formed during the year. Amount of contributions: For salaries of ministers, \$563,020; for congregational purposes, \$487,550; for the boards, \$290,826; for general purposes, \$108,694; total, \$1,400,090; average per member, \$14.17; average salaries of pastors, \$1,038.

The Board of Home Missions returned its total receipts for the year as \$49,321. Two hundred and nine stations had received aid, and returned 18,179 communicants, with an average attendance at divine service of 16,871, an increase by profession of 1,223, and a net gain of 14,163, or 10.4 per cent. The aided stations had contributed \$10,825 to the boards and \$60,011 for salaries.

The total receipts of the Board of Missions to the Freedmen were \$45,246, and its total expenditures were \$46,044. The Woman's Auxiliary Board had assisted by paying the salaries of all industrial teachers and Bible readers, to the amount of \$3,616. Seven stations were occupied, with 5 congregations, 9 Sabbath schools, 418 communicants, 2,678 pupils in Sabbath schools, 6 ordained ministers, 1 licentiate, 47 other missionaries (10 of the missionaries colored), and a total enrollment in schools of 2,810.

The receipts of the Board of Foreign Missions for the year had been \$115,893. It reported of the missions in Egypt and India: Number of foreign missionaries, including women and medical missionaries, 82; of native workers, including ordained ministers, licentiates, and students, etc., 580; of churches, 41, with 10,641 communicants; of additions during the year by profession of faith, 929; of baptisms, 107; of schools, 264, with 12,068 pupils; of Sabbath schools, 238, with 6,766 pupils. Total amount of contributions by the two missions, \$37,197. The present was the fiftieth year of the foreign mission work of the Church.

The General Assembly met at Monmouth, Ill., May 24. The Rev. James Bruce was chosen moderator. A fraternal delegate was received from the Holland Reformed Church, and the proposition for union with that body was made the subject of a report. The Church mentioned originated in a secession from the state Church of Holland. A number of people connected with it came to the United States in 1847, and they now have 110 churches, 64 ministers, and a theological seminary with 4 professors and 54 students. The denomination is in harmony with the United Presbyterian Church in many points. It is Calvinistic, having separated from the state Church on questions of doctrinal restriction; rejects the singing of hymns; and holds an extreme position in opposition to secret societies. The General Assembly declared that it was not prepared to accept the plan which had been proposed for the federation of the Churches, for the reasons, among others:

1. Because we do not believe it is proper to accept any plan of federation which would exclude other evangelical churches, although they do not hold to the Presbyterian system of church government.
2. Because that provision in the plan designed to "prevent the multiplication of weak and antagonistic organizations" would impose restraint upon us in our work of home evangelization which we can not accept.
3. Because we have no guarantee in the proposed plan of federation that the position of our Church on the important subject of praise in divine worship would be respected in the meetings of the federal council.
4. Because the ends proposed can be sufficiently secured by the alliance of the Reformed Churches.

The committee on the subject was continued, with instructions to be guided in further negotiations by these directions. The report on education contained a proposition for the institution of a uniform course of study, which the Assembly voted down, and a declaration concerning the control of the theological seminaries that

The existing theological seminaries are entirely under the control of the synods. These synods have

already substantially defined the extent to which they will accept the control of the General Assembly over the seminaries. There are legal questions concerning the charters, and moral questions concerning the rights of control vested in the synods which have founded, and, with great labor, endowed these seminaries, which would prevent the Assembly assuming control of these seminaries without the consent of the synods.

The subject was referred to the next General Assembly, with provisions for obtaining expressions of the views of the presbyteries upon it for the guidance of that body. The Assembly declared its sense to be that to attend the World's Fair in case the gates are open on the Lord's Day "would be a sin against our risen Lord, and a compromise of our Christian testimony. Therefore we pledge ourselves not to patronize the fair by our presence, or in any other way."

IV. Reformed Presbyterian Church in North America. General Synod.—The General Synod met in the city of New York, May 18. The Rev. John Alford, of Beaver Falls, Pa., was chosen moderator. The report of the Committee of Conference with committees of other Presbyterian churches on a plan of federation was accepted, and the committee was directed to meet again with the other committees for the further advancement of the scheme. A resolution was adopted permitting the use in congregations of the Church of the Psalms of King David in meter, provided no trouble or dissension is thereby stirred up. A measure was adopted to secure a better way, in the keeping of the accounts, of guarding the various trust funds of the Church. In reference to Sabbath observance the synod requested the President of the United States and the President of the World's Fair Commission to "defend the Sabbath-closing law of the Columbian Exposition through the Attorney-General"; instructed the several committees and boards having funds of the Church "to guard against making investments which compromise the position of the Church on the Sabbath, especially in the bonds and stocks of railroads or other corporations that violate the Sabbath by unnecessary work"; and urging all church members represented by the synod to withhold all patronage from the Columbian Exposition in case its gates should be kept open on the Sabbath. A resolution unanimously passed deprecated the enforcement of the "Chinese Exclusion act"—

First, on the grounds of its inhuman aspects, discriminating as it does between the natives of China and other foreigners in many respects no more desirable either as citizens or residents than the Chinamen; and, second, on the ground that the enforcement of this act will entail difficulties and disabilities on Christian missionaries in China and the Christian religion, and the progress of the gospel would thereby be jeopardized.

The report on the signs of the times characterized the "devices for raising money for church work, which in some churches have supplanted the free-will church offering—such as the church fair, the supper, and the raffle"—as "devices of Satan," who "would get good interest on all the money that he invested"; took notice of the numbers of vagabonds and tramps in the country and their possession of the right of

suffrage; of the power of the liquor interest; and of the increase in the use of narcotics and stimulants, as alarming evils.

V. Reformed Presbyterian Church. Synod.—The Synod of the Reformed Presbyterian Church in North America met in Newcastle, Pa., May 31. The Rev. A. J. MacFarland, of St. John, New Brunswick, was chosen moderator. The following statistics were presented: Number of congregations, 122, of which 67 have pastors, and 11 have stated supplies; of ministers, 107, 61 of whom are pastors; of members, 9,874; of pupils in Sabbath schools, 11,824. Whole amount of money raised during the year, including a single gift of \$200,000, \$406,487.

VI. Associate Reformed Synod of the South.—The Associate Reformed Synod of the South met in Sharon church, York County, S. C., in October. Reports were made of active home mission work, particularly in the larger towns, as well as in new fields in remote places, and of the condition of the college and theological seminary at Due West, S. C. Negotiations for union have been going on for several years between the synod and the General Assembly of the United Presbyterian Church. The committee having the subject in charge reported the correspondence since the last meeting of the synod, and asked for instructions. Motions to discharge the committee were voted down, and a resolution was adopted to the effect that "while organic union with the United Presbyterian Church is earnestly desired, though it seems for the present impracticable, the Committee on Union be continued."

VII. Cumberland Presbyterian Church.—The total receipts of the Board of Missions had been \$51,159, of which \$12,178—the largest amount ever reported—were for foreign missions; \$18,656 for home missions; \$5,473 for the work in Chicago, Ill.; \$3,865 for church erection; and the rest for other purposes. In the last two years the Church had given \$12,000 for the establishment of a Cumberland Presbyterian work in Chicago. The mission in Japan showed a gain of 10 per cent. in members over the previous year, and the progress there generally had been very gratifying considering the small number of missionaries. The mission in Mexico had suffered the loss of two missionaries on account of ill health, but was in other respects making substantial progress. The Board of Missions was instructed by the General Assembly to examine into the promise of Indo-China as a mission field, and, if the result be favorable, to proceed to open a mission there. The year's receipts of the Woman's Board of Missions had been \$13,875.

The sixty-third General Assembly met at Little Rock, Ark., May 18. The Rev. W. T. Ferguson, of Illinois, was chosen moderator. An address of welcome was made in behalf of the State by Gov. Fishback, who said that there were in that State more than 3,500 churches, or one to every 322 inhabitants, and that within the past ten years there had been established there more than 1,700 churches, or nearly one for every other day during the entire period. Of the 29 denominations represented in the State, the Cumberland Presbyterians had more than 300 churches and nearly 15,000 members.

The question of the right of a woman to sit in the Assembly was raised when the name of Mrs. Pollie L. Clagett was called as a commissioner by the clerk. Objection was made to the recognition of Mrs. Clagett as a member of the Assembly, and the case was referred to a committee. The committee brought in two reports. The majority report held that, in view of the action of the previous General Assembly, Mrs. Clagett was entitled to a seat as a delegate, and recommended that her name be enrolled as a commissioner, this recommendation being understood not as passing upon the legal or constitutional aspect of the question, but as being in view of the action of the previous General Assembly. The minority of the committee regarded the question to be decided as a constitutional one; held that the action of the previous General Assembly was in abeyance; and therefore recommended that the Assembly should declare that under the constitution at this time women were not eligible to be made ruling elders, and Mrs. Clagett was ineligible to a seat as commissioner. The majority report was adopted, and the woman elder was admitted to her seat. Subsequently the General Assembly, recognizing the existence of honest and earnest differences of opinion within the denomination as to the eligibility of women to the office of ruling elder and deacon, and concerning the binding effect of the deliverance on that subject made by the General Assembly of 1892, in order to settle the matter satisfactorily to the Church, and without intending to express any opinion on the subject, proposed alternative sets of amendments to the constitution to be submitted to the presbyteries for their adoption or rejection. One set of amendments prescribes the substitution of the word *persons* for *men* in certain sections bearing on the subject, and a change in another section so that it shall read: "Any member of the Church, male or female, of mature age and in full connection, shall be eligible to the office of ruling elder or deacon." The other set of amendments proposes the substitution of the words *males only* for *men*. The churches of the denomination were requested not to ordain other woman elders till final action shall have been taken on these amendments.

VIII. Presbyterian Church in Canada.—The statistical reports of this Church show an increase of 283 churches and stations supplied. The whole number of communicants is given as 173,087, or 8,681 more than in 1892; number of baptisms during the year, 10,937, of which 10,061 were of infants; total amount paid for salaries, \$882,017, an average of \$917 per pastor, or \$4.81 per member; amount paid for congregational purposes, \$1,653,216, or \$9.55 per member; receipts for the various schemes of the Church, \$295,475; total contributions for all purposes, \$1,996,171. Since the union, in 1875, the number of families and of members and the revenues of the Church have doubled.

The total receipts for French evangelization had been \$45,000. Two pastors and 4 missionary colporteurs had labored in Ontario; 1 pastor and 2 missionaries in New Brunswick; 18 pastors, 12 missionaries, 7 missionary colporteurs, and 26 teachers in the province of Quebec. Thirty-seven congregations and mission fields,

with 96 preaching stations, had been supplied, and with these were connected 690 Protestant families. One hundred and ninety-two persons had united with the Church, making the whole number 984. Two new fields had been occupied.

The Board of Foreign Missions had received, from the Eastern section, 26,248; from the Western section, \$103,407. Besides the missions in the New Hebrides, Trinidad, India, China, and Formosa, missions were sustained among the Chinese in British Columbia and the Indians of the Northwest Territory. The entire missionary force included 85 ordained missionaries, 82 woman teachers, 11 medical missionaries, 6 of whom were women, and 324 native helpers of various grades.

The General Assembly met at Brantford, Ontario, June 14. The Rev. Thomas Sedgwick, D. D., of Tatamagouche, Nova Scotia, was chosen moderator. An overture was received from the Presbytery of Calgary, calling attention to the need of work for the evangelization of the Mormons in the Northwest. The subject was referred to the Home Mission Committee. An overture from the Presbytery of Maitland called attention to an address delivered on Feb. 27 by Prof. John Campbell, of Presbyterian College, Montreal, at King's College, Kingston, on the "Perfect Book or the Perfect Father," as containing language highly derogatory to the character of God, to the character and inspiration of the Scriptures, and the characters and writings of the inspired penmen, etc., and asked the Assembly to take action in the matter. The case being already before the Presbytery of Montreal, the presbytery was left to proceed in the constitutional way in dealing with it. The committee appointed by the previous General Assembly on the organization of the young people of the Church reported in favor of organizing them along the lines and upon the basis of the Young People's Society of Christian Endeavor. There were 805 societies of that organization in the Church, and they could not be disbanded. The committee hoped to see the society more Presbyterian, it being now too Congregational. The presbyteries were advised to hold stated conferences on the subject of Sabbath observance, and asked to obtain exact information concerning the state of the question within their bounds. The failure of the Parliament to pass a stronger law on the subject was regretted, and the attention of the Government was called to Sabbath labor going on in some of its works. The Committee on Colleges and their relation to the Church reported concerning the method of appointing professors in them, and suggested measures for bringing the appointments more directly under the control of the General Assembly. The report was referred to the presbyteries and the college boards and senates for advice. The Assembly expressed itself ready to entertain the question of union with other evangelical bodies. A committee on the general subject of union was appointed, with instructions to hold itself ready to confer with any similar bodies which may be appointed on the subject by other Churches.

Case of Prof. Campbell.—Charges were presented in the Presbytery of Montreal in June

against Dr. John Campbell, Professor of Church History and Apologetics in the Presbyterian College, Montreal, of teaching heresy in a Sunday afternoon lecture delivered at Queen's University, Toronto, Feb. 27, 1893. The lecture was on "The Perfect Book or the Perfect Father," and, it was alleged, contained expressions impugning the infallibility of the Bible and the perfection of the character of God, as described in it. At a meeting of the presbytery held July 14, a committee which had been appointed to confer with Prof. Campbell reported that in an interview with them he acknowledged that he had spoken somewhat strongly in his lecture, but declared that he still adhered to the main position taken in it, "namely, his disbelief in the entire inerrancy of the inspired revelation of the Old Testament." Prof. Campbell then presented a statement to the presbytery embodying a more explicit definition of his views.

A "libel" against Prof. Campbell was draughted, which, as amended at the meeting of the presbytery on Aug. 1, charged him with holding and teaching (1) a view of the inspiration of the Holy Scriptures which impugns and discredits them as the supreme and infallible source of religious truth; and (2) a view of God which sets him forth as one who does not smite either in the way of punishment or discipline, and who has nothing to do with the judging or punishing of the wicked. The libel was declared relevant. The trial took place at the meeting of the presbytery, Sept. 12, when, after hearing Prof. Campbell again in his own defense and the argument of the prosecution, the court found the libel sustained in both counts. The defendant entered a protest against the decision and an appeal to the Synod of Ottawa, giving as the ground of his action "that the presbytery, in the consideration of the arguments on which the decision was based, failed to weigh the Scriptural ones presented by the defense, which the appellant regards as sufficient to exonerate him from the charges contained in the libel." In reply to this the presbytery set forth that it had "had before it all the arguments and Scriptural references, written and oral, used by Prof. Campbell in his defense, before coming to a judgment in the counts in the libel, but it was unable to discover in them any material modification of the views set forth in the printed address which occasioned the process against him. Besides, when asked whether he withdrew or modified the views complained of, Prof. Campbell declined to comply, and therefore all his pleadings before the court were properly regarded as an attempt to justify the statements of the printed lectures founded in the libel rather than the manifestation of a desire to withdraw or modify them."

IX. Church of Scotland.—The Committee on the Statistics of the Church reported to the General Assembly in May that the whole number of communicants was 604,984, showing an increase of 5,453. The number of elders had increased from 8,856 to 9,085. The total of contributions for the year amounted to £360,587, a decrease of £15,482 from the previous year, being mainly due to the falling off of legacies. The total expenditure for foreign missions had been £10,894, showing an increase of £2,516. The missionary property was valued at £550,-

150. The European mission staff numbered 40 men, with 24 wives of missionaries. Two hundred and seventy-one Christian natives, 8 of whom were ministers, were employed in the service of the mission. Eight hundred and twenty-five persons had been baptized during the year in the various mission fields.

The General Assembly met in Edinburgh, May 18. The Rev. Dr. John Marshall Lang, of Glasgow, was chosen moderator. Prof. Charteris gave notice of a motion, pertinent to the jubilee of the Free Church, to the effect that the Assembly, while it firmly adhered to the position maintained fifty years ago by their predecessors, who nobly struggled to maintain their national Church, record its admiration of the heroism displayed and the sacrifices made for conscience' sake by those who then seceded.

An expression of sympathy with the Irish Presbyterian Church in its apprehensions of disaster to follow the establishment of home rule in Ireland was adopted.

The report of the Commission on the Religious Condition of the People referred to the improved condition of farm servants in respect to wages, but regretted their practical exclusion from society and the consequent temptations to immorality. The report of the Committee on Church Interests defined the position of the Church to be one of opposition to any action of Parliament reversing the ecclesiastical policy of centuries in the relations of Church and state till Scotland had unmistakably declared its mind on the subject, and of reliance on the pledge of the Government for the observance of that condition. The Committee on the Proper Conduct of Public Worship and the Celebration of the Sacraments recommended the preparation of a table or tables of Scriptural readings, to embrace every day in the year, for use in public worship; the printing of the Apostles' and Nicene Creeds at the end of the Hymnal; the giving of authority to ministers to administer the sacrament to sick or aged persons at their homes; and the authorization of a religious service at the burial of the dead, a part of which may be conducted at the grave. The report was adopted and the committee was ordered to report to the next Assembly the replies from presbyteries. Nearly 32,000 persons, showing a considerable increase from the previous year, were returned as belonging to strictly Church temperance societies.

X. Free Church of Scotland.—The General Assembly met in Edinburgh, May 18. The Rev. Walter C. Smith, of Edinburgh, was chosen moderator. The report on the state of religion and morals cited several instances showing that observance of the rules was relaxed in some parts of the Church, with detrimental influences on morality. The present meeting of the Assembly marked the fiftieth year of the independence of the Church, and was made the occasion of celebrating its jubilee. A congratulatory letter on the subject from Mr. Gladstone was read. The moderator delivered a jubilee address. Delegates were present or congratulations received from various churches throughout the world, among which were the United Presbyterian Synod, the Presbyterian Church in Ireland, the Evangelical Missionary Church of Belgium, the Evangelical Society of Geneva, the Welsh Presbyterian

Church, the Presbyterian Church of Canada, the Federal Assembly of Australia and Tasmania, the Churches of New South Wales and Victoria, Otago and Southland, the Presbytery of Natal, the Baptist Union of Great Britain and Ireland, the Presbyterian Church of England, the Wesleyan Conference, the Reformed Church of Holland, the Free Church of Neuchâtel, the Waldensian Church, and the Bohemian Church. Upon the report of the Committee on the Education and Trials of Students, the Assembly agreed to a resolution expressing the opinion that the maintenance of the theological chairs with their present subjects and with no further modifications than the abolition of existing theological tests, as had been recommended by the committee, would be in a high degree anomalous and objectionable. With reference to questions concerning Ireland, the Assembly declared that it was deeply touched by the anxieties arising out of the present political proposals, but could not collectively express an opinion on the political condition. In his address closing the Assembly the moderator remarked that the most interesting feature of the meeting had been the number of those who took part in the disruption in 1843 and had been present at its jubilee commemoration. Of the 474 who signed the Deed of Disruption, only 34 now remained, and of these but 12 had been able to take part in the proceedings of the Assembly. Turning to the subject of thought, the speaker said that the method of scientific criticism had already got a footing in the Church and established the right to be there without injury to their belief in Christ or to their reliance on the sacred records. Let them possess their souls in patience. The faith by which they lived had its roots too deep to be seriously affected by literary criticism. Of course, the Church could not adopt the main scientific and literary results of that half century and remain exactly the same as it was before. Doubtless these had wrought changes in its way of thinking about many things; our ideas of the universe were different from those of our fathers, yet it was God's world to us as much as ever it was to them.

PRINCE EDWARD ISLAND. Legislative.—The last session of the General Assembly of the province was opened at Charlottetown on March 8, 1893, and closed on April 20. The Assembly was presided over by Hon. William W. Sullivan, Chief Justice, who had been appointed Administrator of the Government during the absence of Lieut.-Gov. J. S. Carvell.

The most important act was one involving a revision of the Constitution of the province and certain radical changes in the legislative body. During the session of 1892 the General Assembly passed a bill abolishing the Legislative Council, and providing for a legislature of one house only. The Legislative Council agreed to support the measure, and the bill was forthwith submitted to the Lieutenant-Governor, who reserved it for submission to the Governor-General. On the recommendation of a committee of the Privy Council, which held that the Legislature of Prince Edward Island was competent to pass such a measure, the Governor-General took no action on the bill, and Lieut.-Gov. Carvell was so notified. On April 20 the bill

was signed by the Administrator of the Government of the province and became law.

The Legislature of the province henceforth will be composed of the Lieutenant-Governor and one House, to be called the Legislative Assembly. This will be composed of 80 members to represent the 15 electoral districts, 15 of them to be styled Councillors, and 15 Assemblymen. A small property qualification is required of those voting for Councillors. Every Assembly is to continue for four years, unless sooner dissolved by the Lieutenant-Governor, and there is to be a session of the Legislature once at least in every year. Persons employed in any capacity whereby they receive any public money of the province are not eligible as members of the Assembly; neither are clergymen.

Among the acts passed during the session were the following: To incorporate a law society, and to enable the electors of the province to register their votes upon the advisability of the introduction of a law totally prohibiting the importation, manufacture, and sale of intoxicating liquors as a beverage.

Finances.—The receipts of the province for the year ending Dec. 31, 1892, amounted to \$245,625.28, and the expenditure to \$283,303.57. The Dominion subsidy of \$183,571.04 to the province for the year was nearly triple the sum received from all other sources of provincial revenues for the same period. The chief items in the expenditure for the year were as follow: Administration of justice, \$16,661.05; education, \$114,570.15; hospital for the insane, \$17,952.37; legislation, \$12,500; public works, \$84,981.21.

Wealth.—The inhabitants of Prince Edward Island had on deposit in savings banks in 1893 the sum of \$2,181,000, while on entering the confederation in 1873 they had but \$336,000. During the interval the population increased but 15,000, while the deposits increased more than sixfold.

Education.—From the annual report of the Chief Superintendent of Education it appears that there were 447 schools in the province in 1892, 538 teachers, and 22,169 pupils enrolled. The average salary paid to first-class male teachers was \$467.50, female \$330; and to second-class teachers \$265.23 and \$209.80 respectively.

The estimate of the sums necessary for the Government for the year ending Dec. 31, 1893, amounted to \$283,945.

Agriculture.—The Government of the province collects no statistics of agricultural products. Experiments conducted during 1892 at the Government stock farm show that the ordinary cereals can be successfully produced on the island. The highest yield of wheat produced under those testing operations was 22-66 bushels an acre; of barley, 39-72 bushels; and of oats, 54-11 bushels. The province does much to foster agriculture, and a few years ago a professorship of Agriculture was established in Prince of Wales College.

Fisheries.—The total yield of the fisheries in 1892 was \$1,179,856, and in 1891 to \$1,238,733. The number of men employed in 1892 was 5,020. The decline in the product of the fisheries for last year was more than accounted for in the single item of lobsters, the pack of which

was nearly 1,000,000 cans short of that of the preceding year.

Stock and Dairies.—Of late years considerable improvements have been made in raising farm stock. In recent exhibitions, open to the whole Dominion, held in Montreal and Hamilton, a large share of the prizes was awarded to the horses of Prince Edward Island. Other farm stock is also raised in large numbers. Within recent years companies have been organized for the manufacture of creamery butter and cheese, and the product of the latter for the season of 1893 was valued at over \$15,000 a month.

Manufactures.—The manufactures include starch and soap factories, tanneries, grist, saw and woolen mills, factories for canning and preserving meat and fish, and carriage factories. The capital invested in 1893 was estimated at \$3,143,516, the value of the products at \$4,568,519, and the number of persons employed, 8,506.

PROTESTANT EPISCOPAL CHURCH IN THE UNITED STATES. This Church now consists of 53 dioceses and 18 missionary dioceses or jurisdictions, and has 7 missions in foreign lands under the care of bishops. A larger number of missionary bishops were chosen and consecrated in 1893 than in any other year of the Church's history. The revised Prayer Book proves universally acceptable. The diocesan statistics indicate an increase in 1893 over 1892 in the number of clergy, the number of confirmations, the number of communicants, the number of teachers in both Sunday and parochial schools, and the number attending both. A decrease is shown in the number of parishes and organized missions, in the number of baptisms, and in the amounts of contributions. The sources of information in preparing this article are the published reports of Church societies, Pott's "American Church Almanac," Whittaker's "Protestant Episcopal Almanac," and the "Living Church Quarterly." The general summary of statistics for the year is as follows: Number of dioceses, 53; missionary jurisdictions, 18; foreign missionary jurisdictions, 7; bishops, 78; clergy, 4,369; candidates for orders, 480; postulants, 246; lay readers, 1,495; parishes and missions, 5,872; baptisms (infants, 48,083; adults, 11,899); confirmations, 42,410; communicants, 577,814; marriages, 16,955; burials, 32,866; Sunday-school teachers, 44,371; Sunday-school pupils, 404,822; teachers in parish schools, 405; pupils in parish schools, 10,120; hospitals, 33; orphanages, 31; homes, 79; dispensaries, 2; reformatories, 6.

Domestic and Foreign Missionary Society.—The annual Missionary Council met in Chicago, Oct. 22, 1893, and continued in session four days. The attendance was large, and hopeful belief in rapid extension of the Church was justified by the knowledge that it had been found necessary during the year to divide the missionary jurisdiction of New Mexico and Arizona into two, to erect, out of the dioceses of Colorado, Florida, and Michigan, the missionary districts of Western Colorado, Southern Florida, and Northern Michigan, and to divide into two the missionary jurisdiction of Washington, and also to appoint a general missionary to the Swedes in this country. Among the resolutions adopted by the Council were the following:

That this Missionary Council desires to put on record its solemn conviction that the enforcement of what is known as "the Geary bill," or any similar legislation in reference to the Chinese residing in this country, will have a most deleterious effect upon the work of Christian missions in China.

That a printed copy of the above resolution be sent to every Senator and member of the Congress of the United States.

This was in conformity with the action of the House of Bishops, which, earlier in the year, had presented the following resolution, adopted by the house, to the President of the United States, the Secretary of State, and other authorities:

That this house desires to place upon record the expression of its deep conviction that legislation calculated to bear specially and hardly upon the Chinese race is not only essentially unjust and in violation of the most venerable traditions of our Government, but is also likely to precipitate an antagonism to American citizens residing in China, which may lead speedily to the expulsion of all such residents from China, and to the ultimate prohibition of the extension of American civilization or any of its benefits to that great empire.

The cost of administering the affairs of the society, and making the work known to the Church, was 8 per cent. of the receipts for missions, or 5 per cent. of all the receipts by the treasurer. The number of contributing congregations was greater than in any previous year, 2,891 contributing to domestic missions, and 3,074, in all, to either domestic or foreign, or to both. The number of congregations in the Church is about 5,499, and the amount contributed was \$358,885.72.

Domestic Missions.—The society is responsible for the salaries of the bishops and stipends of the missionaries in 18 missionary jurisdictions, and has given assistance to 37 other dioceses. The whole number of missionaries receiving salaries or stipends during the year was 818. The total receipts were \$342,611.89. From the report of the Commission on Church Work among the Colored People the following extracts are made:

The greater part—in fact, almost the whole—of the work accomplished thus far has been brought into existence by Christian sympathizers in the North. The Episcopal Church not having hitherto realized her duty in this portion of the Master's vineyard, and having allowed other religious bodies to take the lead, must now labor with extra zeal and at some disadvantage, in order to win her place in the affections of the negro. An appropriation of \$59,710 was asked for the coming year, for the purpose of continuing work in 16 States among 7,000,000 colored people.

Foreign Missions.—In Africa, China, Japan, and Hayti the Church has 225 stations and out stations and 1 mission school in Greece. The whole number of laborers is 499, of whom 3 are missionary bishops and 1 is the Bishop of the Haytian Church, besides 2 bishops who have resigned their jurisdictions, but still have connection with their respective fields; 75 are presbyters and deacons, of whom 58 are natives of the countries in which they work, and who have been educated in our own mission schools. In China and Japan there are 5 missionary physicians. Including the wives of missionaries, who all participate in the work, there are 41 other foreign lay workers, and there are 372 native catechists, lay readers, teachers, etc. In 29 boarding

schools, including the theological seminaries and a medical school in China, there are 782 pupils, and in 77 day schools there are 2,929 more. These, with the Sunday pupils not otherwise counted, make a total of 5,223 children under instruction. So far as reported, there has been contributed in the several fields toward their own support an aggregate of \$7,488.26. The estimated value of mission property at foreign stations is \$319,181.17. The missionary bishop of Cape Palmas reports that the mission is deeply concerned because of certain claims advanced by the French Government to lands on the Ivory Coast between the Cavalla and San Pedro rivers on which 10 of the mission stations are located. The work of the mission has also been much hindered by a political upheaval in the district. The appropriations for the fiscal year amounted to \$215,282.03, while the resources were but \$204,764.41.

The Church in Hayti.—New parish churches have been built, and old ones repaired; primary schools have been established; the usefulness of the Normal School of Rural Pedagogy has increased, and a medical dispensary has been opened. The statistics are as follow: Clergy, 14; mission stations, 19; postulants, 2; lay leaders, 19; teachers, 8; Sunday-school teachers, 10; baptisms, 59; confirmations, 8; communicants, 378; Sunday-school pupils, 216; day-school pupils, 141; contributions, \$2,551.90; estimated value of church property, \$18,730.

The Mexican Church.—The original constitution of this Church is, by the Church's own action, temporarily in abeyance. The government is now in the *Cuerpo Ecclesiastico*, which consists of the clergy and lay representatives of the congregations, the episcopal authority being, by election of the *Cuerpo*, in the presiding bishop of the American Church. The Bishop of New Mexico and Arizona is the commissary of the presiding bishop, with power to act for him. The statistics are as follow: Priests, 5; candidates for orders, 5; other readers, 8; congregations, 23; day schools in same, 11; teachers, 11; scholars, 400. (These are only approximate numbers, as the attendance fluctuates considerably, but they are substantially correct.)

In Europe.—The churches under the charge of a bishop of the American Church number 8—in France 3, in Germany 1, in Italy 2, in Switzerland 2; clergy 19; parishes and missions, 8; baptisms, 21; confirmations, 57; communicants, 853; being 120 less than were last reported; Sunday-school teachers, 5; scholars, 50; contributions, \$23,802.92.

The Woman's Auxiliary.—Much attention was drawn to the Woman's Auxiliary to the Board of Missions at the opening of its twenty-second year. Its meeting, held in Baltimore, in the fall of 1892, was the largest general meeting it had held, over 1,200 women being gathered from 50 dioceses and missionary districts; and its offering—\$20,353.16, of which all but \$685.73 was devoted to the Enrollment fund—was the largest united offering, by many thousand dollars, it had ever made.

The Junior Auxiliary, under the guidance of the Woman's Auxiliary, is especially intended to awaken and sustain the interest of the children in the Church in its missionary work. There are

now 14 dioceses in which diocesan officers have been appointed in special charge of junior work. The following is a summary of the money collected and work accomplished by the Woman's Auxiliary and Junior department in 52 dioceses and 14 missionary jurisdictions in the year Sept. 1, 1892, to Sept. 1, 1893: Money—under appropriation to domestic missions, \$22,477.17; to foreign missions, \$22,385.65; specials: domestic, \$100,859.72; foreign, \$21,498.09; united offering, October, 1892, \$20,353.16; other gifts for Enrollment fund, \$3,134.44; total, \$190,708.88. Missionary boxes, 4,391, whose valuation was \$198,749.84, making a total collection whose value was \$389,458.22. Of this, the Junior Auxiliary contributed in money \$21,897.74, as well as 691 boxes, valued at \$16,788.30. The Lenten offering from Sunday schools was about \$76,000. It is proposed that the Woman's Auxiliary place before itself for its united offering at the next triennial the endowment of the episcopate in a missionary jurisdiction, subject to the approval of the Board of Missions.

American Church Missionary Society.—This has 81 missionaries laboring in the home field, and also has charge of the Brazilian and Cuban missions. The former is conducted by 4 presbyters, 1 American teacher, 4 native catechists, and sundry native teachers. It reports 10 chapels, 10 Sunday schools, 4 day schools, and 100 communicants. It was established in 1890 in the southern part of Brazil, and conducts its work in the three cities Porto Alegre, Rio Grande, and Pelotas, and surrounding towns. The services of the Church are translated from the Prayer Book into Portuguese, and the congregations enter with spirit into the responses, the Litany, the chants, and the Holy Communion. The Cuban mission statistics are: Clergy, 3, assisted by sundry lay readers and teachers; chapels, 5; Sunday schools, 5; day schools, 5, with an attendance of 500 scholars. The financial report of the society is as follows: Balance, Aug. 31, 1892, \$21,652.43; received for domestic missions, \$21,068.86; for Cuba, \$1,181.64; for Brazil, \$10,086.83; specials, \$1,015.69; mortgage paid in for reinvestment, \$5,000; total, \$60,005.45; balance, Aug. 31, 1893, \$14,257.73, of which \$12,994.12 is for reinvestment. The securities of the society are valued at \$140,100.

Work among the Jews.—The Church Society for promoting Christianity among the Jews reports that the aspects of the field are encouraging. In New York over 30 Jews have during the year confessed themselves convinced of the Messiahship of Jesus, and the schools are doing effective work among the young. The cash receipts for the fiscal year were \$10,612.69; balance from old account, \$3,009.30; total, \$13,621.99. The disbursements amount to \$8,788.81, and the balance on hand is \$4,833.18.

Building Fund Commission.—This year, for the first time, the commissioners have found themselves in a position to extend aid by direct gifts. A little over \$600 has been thus appropriated, and a still larger amount is available for similar use. Thirty-five loans were made during the year, their aggregate being \$37,283; 16 loans have been entirely paid off, and the mortgages satisfied. The aggregate amount that has once been loaned and has been returned to the fund

now exceeds \$110,000; not a dollar has been lost out of over 200 loans that have been made. The total amount on loan on Sept. 1 was \$134,823.37; the total number of loans that have been made is 236; the amount contributed is \$239,586.37, of which \$13,844.65 was given this year.

Religious Orders.—The religious orders in the Church for men are the Society for the Mission Priests of St. John the Evangelist, founded at Cowley, England, in 1865, established here in 1872; the Order of the Holy Cross, founded in New York in 1881, removed to Maryland in 1892; and the Order of the Brothers of Nazareth, founded in 1896. The sisterhoods of the Church are: All Saints Sisters of the Poor, Baltimore, Md., founded in London in 1858; the Sisters of the Annunciation B. V. M., New York city, incorporated 1893; Sisterhood of the Good Shepherd, New York city; Sisterhood of the Good Shepherd, St. Louis, Mo., incorporated 1867; Sisterhood of the Holy Child Jesus, Albany, N. Y.; Sisterhood of the Holy Communion, New York city; Sisterhood of the Holy Cross, Kansas City, Mo.; Sisterhood of the Holy Nativity, founded 1883; Order of the Holy Rood, a branch in Philadelphia of an English order; Sisterhood of St. John Baptist, New York city, founded at Clewer, England, in 1851, and affiliated as an independent branch in America in 1881; Sisterhood of St. John the Evangelist; Sisterhood of St. Margaret, Boston, Mass., founded in East Grinstead, England, in 1855, and established as an affiliated house in America, 1878; Sisterhood of St. Martha, Louisville, Ky., organized 1875; Sisterhood of St. Mary, New York city, founded 1865; St. Mary, New York city, incorporated 1892; Sisters of St. Mary and All Saints, Baltimore, Md.; Sisters of St. Monica, Fond du Lac, Wis.; Sisterhood of Sts. Philip and James, New Orleans, La.; Order of Deaconesses of the Diocese of Alabama, instituted 1863; Church Training School and Deaconess Home of the Diocese

of Pennsylvania, established 1891; and New York Training School for Deaconesses, established 1890.

Charities.—These include 31 orphan asylums, 25 homes for children, 8 homes for children and adults, 8 homes for adults, 25 homes for aged, and 13 summer homes, and also 6 reformatories, 2 dispensaries, and 67 hospitals.

General Condition of the Church's Affairs.

—During the Church year 4 of her bishops have died, namely: Bishop William Henry Augustus Bissell, of Vermont; Bishop Phillips Brooks, of Massachusetts; Bishop Alexander Gregg, of Texas; and Bishop William Ingraham Kip, of California. The death of 71 presbyters is also reported. Assistant-Bishops George H. Kinsolving and William Ford Bishop have been appointed Bishops of Texas and of California, and William Lawrence has been made Bishop of Massachusetts. Nine other presbyters have been consecrated bishops, namely: Lemuel Henry Wells, Missionary Bishop of Spokane; William Crane Gray, Bishop of Southern Florida; Francis Key Brooke, Missionary Bishop of Oklahoma; William Morris Barker, Missionary Bishop of Western Colorado; Frederick R. Graves, Missionary Bishop of Shanghai; John McKim, Missionary Bishop of Yeddo; Ellison Capers, Assistant Bishop of South Carolina; Thomas Frank Gailor, Assistant Bishop of Tennessee; and Joseph B. Cheshire, Jr., Assistant Bishop of North Carolina. The Bishop-elect of Vermont, Rev. Arthur C. A. Hall, of Cowley St. John's Brotherhood, Oxford, England, having been released by this community and by the English House of Bishops from his obligation of obedience to them, was confirmed by the House of Bishops and will be consecrated early in 1894. Especial cause for rejoicing exists in the fact that, in spite of the financial stringency, there was only a slight decrease in the total amount of contributions.

Q

QUEBEC, a province of the Dominion of Canada; area, about 193,000 square miles; population in 1891, 1,488,586. Capital, Quebec.

Legislative Session.—The Legislature was convened Jan. 12, at the call of Lieut.-Gov. Chapeau, who succeeded the Hon. A. R. Angers (retired in December, 1892) in that office. In his opening address he outlined the general scope and main features of legislation for the session. He remarked that since the closing of the last session the financial situation had markedly improved, and that the sums voted for the ordinary expenses of the fiscal year, though \$400,000 less than for the preceding year, would in all probability be more than enough to meet the expenditures.

The Legislature adjourned Feb. 27. The necessity of securing improved agricultural methods throughout the province induced legislation granting assistance to dairying and agricultural societies. The great abuses resulting from the liberal railway policy pursued by the Government in the past have been made well-nigh im-

possible of recurrence by acts providing for protection of the public interests.

The acts of more general public importance passed by the Legislature were:

To amend the law respecting joint-stock companies. Respecting the issue of provincial debentures to provide for the redemption of the loan of 20,000,000 francs.

To incorporate The Back River Power Company.

To incorporate the Blandford Railway Company.

To incorporate the Canadian Mutual Loan and Investment Company.

To incorporate the Montcalm Railway Company.

To incorporate the Bellechasse Telephone Company.

To incorporate The Cap Range, Sillery, and St. Lawrence Railway Company.

To incorporate the Gaspasia Railway Company.

To amend the law respecting public instruction.

Respecting subsidies to certain railways.

Finances.—The following is the official statement of the provincial revenue and expenditure for the fiscal year ending June 30, 1893:

REVENUE.

Ordinary revenue.....	\$4,366,147 08
Revenue on capital account.....	25,622 40
Receipts on account of advances.....	50,000 00
Receipts, trust deposits.....	18,770 87
Receipts, reimbursement railway subsidies.....	9,757 86
Total.....	\$4,467,278 21

EXPENDITURE.

Ordinary expenditure.....	\$3,881,205 42
Capital expenditure, public buildings.....	288,364 10
Redemption of funded debt.....	71,058 88
Repayment of trust deposits.....	18,147 08
Repayment of railway guarantee deposits.....	240,405 89
Advances to sufferers by wind storm.....	48,080 89
Total.....	\$4,492,106 21

Further payments made during the year from proceeds of loan:

Railway subsidies.....	\$841,085 86
Railway construction.....	9,869 78
Total.....	\$850,455 09

On June 30, 1893, the funded debt outstanding was \$25,104,266.66; less sinking fund invested, \$9,994,000; balance, \$15,110,266.66; temporary loans and deposits, \$3,469,946.88; total, \$18,580,213.04.

The loan of 20,000,000 francs negotiated by Hon. H. Mercier a few years ago in Paris matured July 15, 1893. To meet this obligation, Hon. John S. Hall negotiated, in May last, a second loan of 20,000,000 francs. The loan was for two years, bearing interest at 4 per cent. per annum, and payable semi-annually. This loan did not increase the funded debt of the province.

Real Estate.—Assuming municipal returns for assessment purposes as representing half the actual value of real estate, the value of all the taxable real estate in the province would amount to about \$382,000,000. The value of the property in the province which is not taxed is equal to \$69,000,000, the property in Montreal alone that pays no taxes amounting to \$21,000,000. Nearly all this untaxed property throughout the province is exempt on religious grounds, and greatly increases the burden of general taxation.

In addition to the Dominion subsidy of \$1,278,952.80 to the Province of Quebec for the fiscal year 1893-'94, the following, among other less important amounts, were granted at the last session of the Canadian Parliament: For public works, \$126,090; harbors and rivers, \$32,100; Soulages Canal, \$1,000,000; St. Lawrence river and canals, \$250,000; fisheries, \$16,000; collection of revenue customs, \$210,345; and Lachine Canal, \$50,000.

Industries.—The lumber industry is the most important in the province. The revenue derived by the Provincial Government from the woods and forests for the year ending June 30, 1893, amounted to \$688,722, being \$264,724 in excess of the revenue from this source for the year before.

The following is a close approximation of the manufactures of Quebec for the last fiscal year: Number of establishments in operation, 24,112; capital invested, \$120,969,000; number of employees, 118,830; wages paid, \$32,600,000; and the value of the products, \$155,295,000.

Education.—During the year ending June 30 last, the amount expended by the Government of the province for public instruction was \$390,509.67. This, added to the amounts paid by municipalities and cities for the support of schools for the year, would make the total expenditure for public instruction over \$4,000,000.

Exodus of French Canadians.—The emigration of French Canadians from the rural districts to the cities, and to the United States, was made the subject of a parliamentary inquiry during the session of 1892, and a committee was appointed to institute an investigation. This committee submitted its report at the last session of the Legislature, in which it assigned as the chief causes old-fashioned and unscientific methods of agriculture, extravagance and love of dress and display, natural love of travel and adventure, great cost of judicial proceedings, the credit system, and the higher wages obtainable in the United States.

The closing of many manufacturing establishments last summer in the New England States led many thousand French-Canadian artisans to return to the province.

Pilgrimages.—The pilgrimages to the shrine of Ste. Anne, at Ste. Anne de Beaupré, a pretty village on the St. Lawrence, 21 miles from Quebec, have of late assumed great magnitude. Probably in no other country in the world would a railroad be specially built for the convenience of pilgrims. This was the main, if not the sole reason for the construction, a few years ago, of the Ste. Anne Railway from Quebec to Ste. Anne de Beaupré. A few days after the opening of the road Cardinal Taschereau visited the village and blessed the railway and all its belongings. Since then the influx of pilgrims has enormously increased. In 1892 the number of organized pilgrimages was 149, and the number of pilgrims 124,000. During 1893 the number visiting the shrine was estimated at 184,000. Many miracles are reported to have taken place, and a great number of disused crutches, canes, etc., are exhibited as evidences of the cures effected.

Railway Extension.—The most important work of recent railway construction in the province was the completion of the line from Roberval, on Lake St. John, to Chicoutimi, at the head of navigation on Saguenay river. The road is 64 miles long, and is a continuation of the Quebec and Lake St. John Railway, 180 miles long, connecting Quebec with Lake St. John and the fishing region.

R

RAMIE, CULTIVATION AND MANUFACTURE OF. Ramie is the Malay name for a broad-leaved, shrubby, fibrous plant of the nettle family (*Urticaceæ*), often called the "stingless nettle," known to botanists as the *Bahmeria nivea*, and sometimes commercially as "rhea"

and "rhéa." In China it is called "*tchou-ma*," in treaty ports of that country "China grass," in Sumatra "*caloe*," and in Europe and America by the Malay name, ramie. It grows with 10 or 15 shoots, springing from one root stock, and attains at best a diameter of $\frac{1}{2}$ of an inch and a

height of 3 to 8 feet. Three varieties are used in the manufacture of textile fabrics, cordage, paper, and other things. In the order of their values, these are: Green ramie, or *ramie verte* (*Urtica utilis tenacissima*); white ramie, or *ramie blanche* (*Urtica nivea*); and another species of white ramie, commonly called *candicans* (*Urtica candicans*). Green ramie grows to a height of 7 feet, and is especially distinguished from the other varieties by the height and by the leaf's being heart-shaped toward the petiole. The leaf is light green, but the under side is usually covered with a grayish down, which appears in the squares formed by prominent but pale-green veins. This variety is of very vigorous growth, producing more stalks to the plant and more abundant and better fiber than the others, and from the remarkably tenacious quality of the fiber it is called the *tenacissima*. It grows in the warmest climates of the world, but resists cold to the extreme of 8° centigrade, and if certain precautions are taken, it supports 10°; but it requires a high and even temperature during the period of vegetation. Manufacturers pay the highest prices for the raw material of this variety.

The white ramie, or *nivea*, grows nearly as high as the green ramie, has a leaf slightly tapering toward the petiole, the upper side bright green and the under side covered with down that is snow white on the young leaves, and silvery to light gray as they mature, with veins slightly reddish. When it is dry the leaves recover whiteness and the veins are red brown. This variety resists the cold better than the green ramie, but grows—in Europe and America, at least—a fiber less in quantity and inferior in quality. M. P.-A. Favier, of France, the chief authority on this subject, considers the *nivea* to be the same variety as the *tschou-ma* of China, which produces a magnificent fiber.

The ramie *candicans* grows to a height of 3 feet, which distinguishes it from the other two varieties; but other marks are in the leaf, which tapers very much toward the petiole, and is dark green on the upper side and grayish white on the under side. It is of small importance.

The ramie stalk consists of an outer bark, which, like the leaves, is useless except for fuel to run the decorticators and to return to the soil as a fertilizer. This covers an inner bark or bast, which contains the textile fiber besides other tissues and mucilaginous substances that must be removed before the fiber can be manufactured. The seeds, resembling hemp seed in shape, are either jet black or pure white, and are extensively used in confectionery by the Chinese. The plant is propagated by seed, by cuttings, by layers, and by division of the roots. In raising from the seed, the greatest care is necessary. The seed is so small that planting in the field is extremely uncertain, and hot-house planting is preferable. After sowing, the seeds are covered thinly with sifted earth, and shaded from the sun till the plants are 2 or 3 inches high. Then sunlight is admitted gradually, and after five or six weeks they are strong enough to be transplanted. The East India method is to propagate by cuttings of the spring-grown stems when they are fully ripe and the epidermis has turned brown. The stem is cut into lengths to include 3 buds, and care is

taken to leave $\frac{1}{4}$ of an inch above and below the buds. These are planted a foot apart, with the central bud on a level with the soil, and, in fair weather, they are shaded from the sun for ten days or more. As the plants mature, they are placed farther apart, to an average distance of 3 feet. Propagation by division of the roots of fully matured plants is conceded to be the most practical method and the one that gives the best results in America. Roots are planted from 2 to 4 feet apart, in furrows 5 or 6 inches deep, and at first are hilled like corn or potatoes; weeds are kept down till the plant is well started, after which they are kept down without labor by the rankness of the ramie's growth and the density of its foliage. In India a rich loam has been found to suit the plant best, but it will grow in almost any soil there, provided there is plenty of moisture and thorough drainage. Everywhere that it has been tried in a wet soil it has failed to thrive. It is reported to the United States Government by Charles Richards Dodge, special agent in charge of fiber investigations for the Department of Agriculture, that "the ground must be well prepared by plowing at least 10 inches deep, well pulverized, and, if not naturally rich, well fertilized." In the last report (1891) of the agricultural experiment stations of the University of California, Prof. Eugene W. Hilgard, Director of the Stations, says: "It is hardly necessary to remind any intelligent farmer that only strong soils can be expected to produce in one season a crop of 10 tons per acre of dry stalks of any kind, and that few can continue to produce such crops for many years without substantial returns to the land, no matter how fertile originally; but there is no reason why the offal of the ramie crop should not be regularly returned to the soil. The leaves can be and usually are dealt with by stripping the stalk on the ground, leaving them where they grew. As to the stalks, it is true that with 3 or 4 cuts per season it will be difficult to deal with the large mass of refuse by spreading it on the stubble, although in the more northerly portions of the area of cultivation it may be desirable to use this material for protection against frost. But as the return must either be made or fertilizers furnished, the proper mode of procedure will be to make compost heaps of the trash, and thus render it less bulky and more convenient for spreading on the stubble after the last cut." In connection with the preparation of the stalks for manufacture it is shown, from Mr. Dodge's reports, that about one quarter of the refuse may be used to fuel the decorticators, leaving almost the exact quantity desirable for fertilization. Prof. Hilgard continues: "This, in the case of strong soils, is all that will be required to keep up production for a long time, although the raw fiber sold represents a larger portion of the soil's plant food than in the case of cotton, in which the return of seed and stalk will maintain production indefinitely on any soil capable of yielding a profitable crop. When no returns are made, ramie will prove even a more exhaustive crop than is cotton when the seed is not returned; and those engaging in its culture had better understand from the outset that they can 'rob the soil' more effectually than with wheat. On the strong black adobe soil of the Berkeley experimental plot, where purposely

no return or fertilization of any kind has taken place, the crop of 1890 was fully as large as any previous one within the four years in which weighings had been made."

French authorities say that in all parts of the world ramie is most successfully grown within the belt bounded by the forty-third parallels; and the nearer to the equator and more moist the atmosphere, the greater the success, given the chief necessity, a porous soil. Within the first year after planting the ramie yields at least one good crop in northerly countries, and two in the South; and thereafter for five years it yields from two to five cuttings a year. In France, Spain, and elsewhere, between the thirty-eighth and the forty-second parallels, the yield is about two crops a year; in the region of the thirtieth parallel there are three crops, and still nearer the equator, as India, Algiers, Florida, etc., there are four good annual crops; in Mexico and in Venezuela there are at least five. In well-cultivated soils one acre grows about 1,400 plants, and the yield, weighed dry and without the leaves, is, in round numbers, first year, 3,500 pounds; second year, 7,000 pounds; third year, 1,058 pounds; fourth and subsequent years, 1,500 pounds, which is sometimes increased to 1,800 pounds.

In harvesting, the stalk is cut within 6 inches of the ground, when on the oldest portions the outside bark begins to turn brown. In dry climates it can be gathered in large masses and so transported to be decorticated green, or to be dried in the sun; but in moist climates great care must be taken to decorticate it green at once and on the field, or to dry partly by kiln. Most of the ramie produced in the world at present is grown in China, where it has been cultivated and the fiber made into a variety of useful articles from time immemorial. According to M. Favier, it is the white ramie, or *nivea*, that is there cultivated to the highest degree of fiber quality yet known, equal to, if not surpassing, the best results obtained elsewhere with the green ramie. The principal fields are in the basin of Yang-tee-Kiang river, in the provinces of Kiangsi, Hupeh, and Szechuen, between 30° and 33° north latitude and 100° and 115° east longitude. Kioo-Kiang and Hankow are the shipping ports, from which in 1891 the maximum export of raw material to all countries was 10,000 tons. Most of this goes to Japan. Up to within a few years, the United States Agricultural Department is informed, on good authority, 400 tons (at \$130 a ton) would represent the maximum quantity sent to all European markets taken together. To the United States there has been no export of this fiber, except by experimenters in its manufacture. The soil of the *Ichou-ma* districts of China is red clay, mixed with sand, very rich of itself, and restored about every five years. The cuttings are made in May (when the longest and best fiber is obtained), in August, and in October. The stalks are thrown at once into water and rotted (as with hemp), then beaten with a flail, and the outer bark is carried off by water. Another method is to strip off the leaves and outer bark with a knife and slit the fiber into ribbons. The inner bark, or bast, containing the fiber, is dried by two processes. Such fiber as is intended for sewing twine and grass cloth is

dried over a charcoal fire, which gives it a light color, although the Chinese maintain that the light-colored fiber is produced by a different soil from that of the brown fiber, used for fish nets, cordage, etc., which is dried in the sun. The separation of the bark from the bast is done by women and children, and the rudeness of the method tends to injure the fiber as well as to enhance its cost. The yarn for weaving cloth and the many other working materials are made out of the fiber by hand, and without difficulty the gum (one of the chief obstacles in machine work) is removed by soaking in hot water for a short time before using. About 1887 a British merchant of Hankow set up a plant for preparing the fiber by machinery at the small town of Wu-sueh, 80 miles from Kioo-Kiang. It is said that the experiment was successful for a year, after which the natives, believing that there must be a great demand for the fiber, raised the price of the stalks till it was impossible to run the plant at a profit. The Chinese for centuries have used the ramie fiber for fish lines and cordage, on account of its superior firmness and impurities. The outer garment, the long blue robe that is worn by nearly all the Chinese people, and also the exquisite cambrics for the underwear of the nobility, are manufactures of the *Ichou-ma*.

Varieties of the plant have long been grown in India, Japan, the Sunda Islands, East Indies, especially near Lahore; in Java, Borneo, Sumatra, Algeria, and Egypt—everywhere that it is known and where hand labor is cheap enough to be employed in separating the fiber from the bark. Experimentally it has been raised in Transcaucasia, in Hungary, southern France, Italy, Spain, and in the British island of Jersey, only to prove, however, that the European climates can not produce remunerative crops. In the Western Hemisphere it flourishes in the West Indies, Hawaiian Islands, Mexico, Guatemala, Colombia, Brazil, and in many parts of the United States.

The introduction of ramie into countries where hand labor has a price has been impracticable until some mechanical, chemical, or other labor-saving process could be found to separate the bark from the bast (decorticate) and remove the gum from the fiber. Two plans have been pursued in the effort to accomplish this. One is the "wet" process, in which the green stalk is operated upon, requiring appliances somewhat distinct from those used in the preparation of hemp or flax fiber. This seems to have the best success in countries having a constantly moist atmosphere. For this, the first process is a breaking of the brittle and brash stems, fresh from the field and stripped of their leaves, by a modification of the ordinary breaking process applied to dry stems of hemp. Then the stalks are rolled into bands for the better preservation of the parallelism of the fiber, and dried by artificial heat, till gum and bark are brittle enough to be removed by beating and combing. Sometimes the crude fiber is passed directly into the alkaline bath (mostly of common soda), which is always required to remove the last of the gummy matter. The final process is combing. In the "dry" process the mechanical operations are substantially the same as in the case

of our familiar fiber plants. The stalks are first allowed to dry in the field, if this can be done, and when dry they are subjected to the action of breaking, and of beating and combing machines that remove stalk and bark, with gum; after which they are put into the alkaline bath, as in the "wet" process.

Some Englishmen were the first to seek to introduce ramie into Europe, about one hundred years ago, and a decorticating and degumming machine was the first requisite, as the want of it has remained the obstacle to ramie's success as a useful commodity in modern commerce. The first attempt to decorticate the plant stalks by machinery was made in 1816 in India, whither England sent a flax and hemp machine for the purpose. It failed, and so also did all other efforts at that time. At the London Exhibition of 1851 the product was shown in every condition from the crude fiber to woven fabrics. Three prizes were awarded, and interest was revived upon the introduction of the plant into several new fields for cultivation; and, somewhat later, still another impulse was given to the search for a decorticating process upon the threatened scarcity of cotton at the outbreak of the civil war in the United States. During the past thirty years there have probably been 100 inventions for this purpose. In England much attention has been given to the matter, and to experimental culture of the plant; and Dr. Morris, of the Royal Kew Gardens, is one of the chief authorities on the subject. In France, where the subject was taken up next and where it has been assiduously pursued for half a century, there is a long list of fiber merchants, manufacturers, and inventors who have become distinguished in their efforts to bring this fiber into popular use. Among them is M. P.-A. Favier, director of the principal ramie factories of France and inventor of the only decorticator that worked successfully. Others are: Alexandre Thibaud, of Nîmes; Dr. Granguard, of Marseilles; Count of Malartie, of Dijon; Dr. Alquié, of Montpellierre; Baron de Brais; Numa Bothier; Hardy, of Algiers; Bailly, of Nay; Rolland and Boski, of Paris; Senator Ferray, of Essonnes; Goncet de Mas, of Padua; Pinchon, of Rouen; Mouchel, of Elbeuf. These gentlemen, after prolonged failure, have at length produced in France a fabric that has begun to displace flax, hemp, cotton, and silk.

At the outbreak of the civil war in the United States (1861) the first ramie factory of Europe was established by M. Thibaud in Nîmes. It has survived many vicissitudes, and now supplies the mills for the French army. About the same time M. Favier began a public advocacy of the value of the fiber, and the importance of placing it among the chief industries of France, also pursuing his inventions for decorticating and degumming.

In 1881 the first French ramie company was founded and the experimental cultivation of the plant undertaken in several places in France, in the north of Spain, and in Egypt, with factories for decortication. Cultivation did not succeed, and factories at Entraigues, near Avignon, at Voiron, and in the department of the Nord were fed on raw material from China, which was too costly for financial success, but enabled the society to show results. Since then M. Favier has

made still greater improvements on his machines. The stalks, stripped of leaves and of any size or length, are introduced into the machine, an operator being required at each end, to feed in the stalks and remove the fiber. The ribbons are delivered free from wood, parallel and unbroken, without waste. The number of stalks introduced varies from 60 to 100 a minute, and 6,000 to 11,000 pounds of stalks may be passed through the machine in a working day. One-horse power is required to drive the machine, and the refuse of the stalks is used for fuel. The machine is mounted upon wheels. Its weight is about 1 ton, and its cost is about \$400. Calculating upon three cuttings a year and an average crop of 2,640 pounds of green stalks to the acre, and the use of the machine for six weeks at each cutting, one machine will suffice for about 15 acres.

Improved machines for decorticating ramie in the dry state have also proved satisfactory. They are considerably higher in price (\$500 to \$900), the capacity being relatively greater, but have less interest for Americans, as the moist climatic conditions of the most successful ramie-growing districts demand a machine to decorticate the stalks green, and immediately after the cutting, otherwise kiln drying is necessary to prevent great loss from damp heat. The cloth of ramie does not lint. Several of the largest restaurants in Paris have adopted ramie table damask instead of linen. Druggists, curtains, furniture stuffs, and light materials for ladies' robes have the brilliance of silk; and cordage, fish nets, and sail cloth are not rotted by water. The War Department has adopted it for cordage and cables, war balloons, and powder sacks, and the Bank of France now uses it for bank notes, because it is lighter and at the same time more substantial than the material formerly in use, besides better to print on.

The specific gravity of ramie yarn is less than that of linen yarn in the ratio of 6 to 10, so that 1 kilogramme (2½ pounds) of linen yarn No. 10 measures 6,000 metres (over 6,600 yards), while the same weight of ramie yarn measures 10,000 metres. On the other hand, ramie yarn is heavier than cotton in the ratio of 6 to 5. It is easily distinguishable from other yarns by its high luster and silky appearance, and in its fiber by its great length, which is often 25 to 40 centimetres and more (from about 1 to 1½ yard), by a certain straightness and stiffness, and by the decided superiority in breadth, which is four times that of flax, often six times that of cotton, and twenty times that of silk, while for strength the ramie is at least twice as strong as the best hemp.

Mr. Dodge reports to the United States Department of Agriculture that "a new use for the fiber is in the manufacture of 'absorbent.' It is said that while cotton lint, specially prepared for this purpose, absorbs 37½ per cent. of water, actual tests show that ramie absorbs 87·9 per cent. This substance is already on the market."

The model ramie factory is that of Valobre, in the Department of Vaucluse, which is now running at considerable profit. It stands on one of the water courses that escape from the celebrated fountain of Vaucluse, and, with its dependencies, occupies more than 12 acres, entirely surrounded by water. The principal buildings form

a hollow square, and include mills of 4,500 spindles and a special twisting and combing apparatus for the material for bank notes. The factory also spins ramie thread for *passementerie* and hosiery, most of which is shipped to England, Germany, and Spain.

In Austria a process for preparing ramie fiber has been patented by Th. Eg. Schiefner, and is in successful operation in a mill at Bregenz, which has been in operation since June, 1890, and another at Emmendingen, Baden. Dr. Karl Hassack says: "By this process is obtained a fiber of pale, yellowish-white color and of silken luster. It is prepared in combing machines for spinning, and finally spun to yarn. Yarns are sometimes found in the market raw white, but generally are bleached or colored, or 'lustered,' in the mills. The last operation imparts to the fiber its complete beauty and silk luster, while raw yarn looks rough and dull on account of numerous projecting fiber ends. The factories at Bregenz and Emmendingen spin in single, double, triple, etc., 15 different sizes of thread." "In Germany," says the same authority, "it is in frequent use by the manufacturers of Berlin, Apolda, and Liegnitz, and its employment is daily gaining ground. Italy and Spain have also taken it up."

In all countries of Europe ramie has been worked almost wholly upon line-spinning machinery, where it is necessary to keep the filaments straight, or parallel, like flax or silk. Both silk and woolen machinery (that for working "long wool") have been used abroad, though the best results of all seem to be produced by flax machinery, modified to the requirements of the new fiber. In the United States the Government and private citizens became interested in the fiber from the showing in the London Exhibition of 1861; in 1855 specimens were obtained for examination, and experiments in culture and manufacture were at once introduced. At the Paris Exposition of 1889 the United States exhibit of ramie, while not large, was sufficient to show that superlative qualities of the fiber can be produced here in unlimited quantities. The Government sent a special agent to the Exposition, who reported on the products, machines, and manufactured fabrics there shown, and further efforts have been made in many ways toward establishing the industry here.

New Jersey some years ago passed a bounty law for the cultivation of the plant, and in Pennsylvania it has been grown with some success; also in North Carolina, South Carolina, Virginia, Georgia, Louisiana, and elsewhere, but the data of actual crops are difficult to obtain except from California, and little more than experimental plantings have been made. California, in 1891, passed an act for the purpose of encouraging the cultivation of ramie in the State, and appropriated \$5,000 each for the two following years to be expended under direction of the State Board of Agriculture for the purchase of ramie roots to the extent of \$1,000 worth in one year, for free distribution to farmers, and in the payment of a bounty of 1 cent a pound for merchantable ramie fiber. Prof. Hilgard says: "By actual trial, the culture of ramie has been found to be readily feasible in all the larger valley regions of the State so far as the

successful growth of the plant is concerned, but it will doubtless prove most profitable where a long growing season combined with irrigation permits of making 3 or 4 cuts annually. In the Kern valley there is little difficulty in getting 4 cuts of good size and quality, and the same is probably true on the stronger soils as far north as Fresno, and southward in the valley of south California. In the Sacramento valley 3 cuts can doubtless be obtained when irrigation is employed, or in naturally moist land. At Berkeley and elsewhere on the immediate coast 2 cuts (the second usually a small one) are all that can be counted on, but in the warm valleys of the Coast range there may be from 2 to 3 full crops. Experiments at the Berkeley Station show an average rate of about 9,000 pounds of dry stalks per acre for the first cut and about 5,210 pounds for the second." Mr. McAfee, of Bakersfield, Cal., says the best fiber is produced when 3 instead of 4 cuts a year are made. The total yield of 3 will not differ materially from that of 4. The San Joaquin Valley Experimental Station reports that ramie grows there successfully, even on light alkali soils, and that it has been distributed to many farmers.

The first United States patent for a decorticator was taken out Sept. 17, 1867, by Dr. Benito Roehl, and within the next few years hundreds of the machines were made in New Orleans and offered for sale at \$225 each; but they failed to work successfully. Other inventions have followed with no better success, and within the past four years at least 10 American machines have been brought before the public. The Agricultural Department, in September, 1892, authorized a trial of ramie decorticators at the Louisiana Sugar Experiment Station, and the Oakburne Plantation, at Lafayette, La., grew stalks to afford tests of ten-hour trials, instead of the usual tests of a few minutes. But 8 machines were entered, and none of them could work the usual run of fiber stalks as they come from the field; or, after running well for a short time, they clogged long before the limit of time was reached.

Both coarse and fine yarns have been carded and spun in this country on cotton and wool machinery, without alteration, and this by the ton. These yarns bring 75 cents to \$1 a pound in the gray, and in colors \$1.50 to \$2 a pound. Cotton, worsted, and silk colors all take readily, and are fast, and jet black has been produced here for the first time. A firm of New England experimenters, in 1890, first degummed and spun ramie in an economical manner. Their degumming is carried only to the point where a *filasse* is produced, which, when separated and broken into short lengths on the Fearnought & Garnet machines, is sufficiently soft and pliant to work well on woolen machinery. Since then some spinners of Paterson, N. J., have produced a high grade of table linen, toweling, laces, plush, chenille, and other fabrics from line ramie, the natural combed fiber. In Jersey City a large company has been established to degum for American manufacturers Chinese ramie.

REFORMED CHURCHES. I. Reformed Church in America.—The following is a summary of the statistics of this Church as they were reported to the General Synod in June,

1893: Number of particular synods, 11; of classes, 85; of churches, 603; of ministers, 598; of licentiates, 20; of families, 53,093; total now in communion, 97,520; number of baptized non-communicants, 41,324; of catechumens, 36,037; of Sunday schools, 884, with 119,758 members; of baptisms during the year, 5,597 of infants and 1,194 of adults; of members received on confession, 5,435. Amount of benevolent contributions, \$246,419 for denominational and \$84,030 for other objects; amount of congregational contributions, \$1,095,764. The contributions to the Board of Domestic Missions exceeded \$86,000—the largest amount ever contributed in one year. The board likewise returned a larger number of admissions to the mission churches than in any previous year. The arrangements with the Presbyterians and Congregationalists for the observance of comity in the operations of the home missions had been efficient in preventing unnecessary multiplication of churches and friction resulting therefrom. The board had aided in its Eastern and Western fields 177 churches and missions, having 10,409 members and 13,100 pupils in Sunday schools, in which 1,066 members had been added on confession.

The Board of Foreign Missions returned a total of receipts from all sources of \$111,672. The missions (in China, India, and Japan) included 15 stations, 202 out-stations, 26 ordained and 43 unordained and assistant missionaries, 36 native ordained ministers, 356 other native agents, 55 churches with 5,799 communicants and 467 received on confession during the year, 4 theological schools with 58 students, 14 seminaries with 333 male and 393 females pupils, and 154 day schools, with 4,315 pupils. The hospitals (China and India) had 18,870 patients.

The ninth annual missionary convention of this Church was held in Newark, N. J., Nov. 14 and 15. Subjects pertaining to domestic and foreign missions, the part of the young people in missionary work, and woman's work for missions were discussed.

General Synod.—The eighty-second General Synod met in Asbury Park, N. J., June 8. The Rev. Cornelius Brett, D. D., was chosen President. The Special Committee on Federal Union with the Reformed Church in the United States reported that all the classes except that of Arcot, India, which was excused on account of its distance, had reported their approval or disapproval of the union and of the recommendations made in the majority report of the previous General Synod. Sixteen had approved, 18 had disapproved. Among those disapproving the South Classis of Long Island overtured the General Synod to invite the co-operation of the Reformed Church in the United States in perfecting the plan of federal union that shall include all the Reformed Churches holding the presbyterial system. The General Synod adopted the following resolutions and minute:

In view of the nature of the reports received from the classes on the proposed federal union, the following is recommended:

Whereas, A majority of the whole number of the classes have reported to this synod their disapproval of the proposed articles of constitution and federal union between the Reformed Church in America and the Reformed Church in the United States with

the amendments and understandings submitted by the last General Synod in order that the mind of the Church might be ascertained; therefore,

Resolved, That this synod accepts these reports as evidence that the mind of the Church is not in favor of the adoption of the said proposed articles of constitution and federal union, and that further consideration of the said articles be indefinitely postponed.

While offering this recommendation, the committee deem it proper to add that in their judgment the disapproval reported by a majority of the classes does not in the least degree indicate any want of fraternal affection for and confidence in our brethren of the Reformed Church in the United States. It only indicates that for some reasons in some classes, and for other reasons in other classes, the Church is not ready to consummate this plan of union at this time.

Nor does the disapproval reported cast any reflection upon the commissioners of the two Churches by whom the proposed plan of union was devised. No others stand, or deserve to stand, higher than they in the confidence of their brethren. The task which they undertook was not assumed by themselves, but was imposed upon them by the Churches. It was difficult by reason of both its magnitude and its novelty. It is no disparagement to them that such an attempt does not prove immediately successful. Notwithstanding the partial failure and the consequent disappointment of many cherished hopes, their work has not by any means been in vain. Through the negotiations and correspondence and personal and fraternal intercourse which have been carried on in recent years, the two sister Churches have become better acquainted with each other, the ties of confidence and affection between them have been strengthened, and although the present effort toward a closer external union has not succeeded, it will serve to prepare the way for the success which God will surely grant, and, as we believe, at no distant time. Whether it is advisable at the present time to devise some other and more acceptable plan of union, we leave it to the wisdom of the synod to decide.

Also, without further recommendation, we leave it to the wisdom of the synod to decide what course to adopt concerning the overture from the South Classis of Long Island looking toward a federal union of a broader scope.

The synod commended the subject of the Sunday opening of the Columbian Exposition to the hearts and consciences of the people, urging them to do all in their power to prevent the secularizing of the Lord's Day through the fair; recognized the unanimity of the Chicago brethren and of the Reformed Church generally against Sunday opening; appointed June 25 as a day of special prayer for God's blessing upon his day of rest, and for union in praying "that he will overrule so that the counsels of the ungodly shall be put to naught, and so that our American people may learn to honor him and to be true to their heritage"; and declined to participate in the Parliament of Religions. A resolution of the synod condemned the act of Congress requiring registration of the Chinese as "a direct violation of treaty obligations, a stain on our national honor, prejudicial to American interests, commercial, educational, and religious," and directed a memorial to be sent to the President and Congress asking for its earliest possible repeal. The Arabian mission, which had been established a few years before at Bosrah, Turkey, by individual enterprise, was incorporated with the General Synod's Board of Foreign Missions.

II. Reformed Church in the United States.—The statistical report of this body for the past

three years, presented to the General Synod in May, gave the following numbers: Of synods, 8; of classes, 56; of ministers, 885; of congregations, 1,563; of members, 212,890; of members unconfirmed, 127,037; of persons confirmed, 32,392; of persons who communed, 160,314; of Sunday schools, 1,563, with 13,319 officers and teachers and 149,023 pupils; of students for the ministry, 285; amount of contributions for benevolence, \$649,892; amount of contributions for congregational purposes, \$3,022,174.

The Home Mission Board reported that the contributions of the Church at large for home missions during the past three years had been \$124,921, while the missions had raised \$27,116 for benevolence, and \$233,946 toward their own support. One hundred and thirty-six missions were supported in various parts of the United States, and with them were connected 157 Sunday schools with 15,749 pupils, teachers, and officers. Efforts were being made to introduce mission work among the Hungarians and Poles in the United States. The services of two ministers from Hungary and Austria had been obtained, they being stationed at Cleveland, Ohio, and Pittsburgh, Pa. Both had been successful, and the first Reformed Church for Hungarians was dedicated at Pittsburgh in 1892. There were now 16 congregations of this nationality in different parts of the United States. Applications had been received from colonies in New York, New Jersey, Illinois, and Canada for missionaries capable of speaking the Hungarian language. The board had organized church-building funds of \$500 each, of which there were now 24, nearly all of which were loaned to missionaries.

The Board of Foreign Missions had 10 laborers under its care in the foreign field with, in Japan, 9 congregations, 80 preaching stations, 1,730 members, 22 Sunday schools with 922 pupils, and 8 native ministers. The annual revenue for the foreign work had been, in 1890, \$20,260; in 1891, \$19,357; and in 1892, \$25,015. The present indebtedness of the board was \$14,000. Nearly 200 pupils, many of whom were studying for the Christian ministry, were enrolled in the seminary at Sendai, which is described in the report as "the most complete Christian institution of learning in northern Japan." Sixty Sunday schools of the Church in the United States had undertaken to pay \$60 a year toward defraying the expenses of theological students.

The General Synod met at Reading, Pa., May 24. The Rev. Thomas G. Apple, D. D., LL. D., was chosen president. The new constitution reported by the committee having the subject in hand was discussed item by item, and the form determined in which it should be sent down to the classes for their action. A committee reported concerning correspondence which it had had with the Reformed Bund of Germany and Switzerland. The report embodied recommendations for the establishment of port missionaries at Bremen, Hamburg, and other ports of Germany and Holland; that German copies of the proceedings of the Synod be sent to the European synods; and that committees be appointed to take charge of young men coming to the United States to enter the ministry. The Synod directed that a memorial be sent to the Classis

of Amsterdam recognizing the interest given by it to the Church in this country in its early days, and the officers of the Synod were appointed a committee to convey it. A proposition to combine the societies of Andrew and Philip and of Christian Endeavor with the Sunday schools, under one grand organization, to be known as the Reformed League of Young People's Societies, was referred to a committee with instructions to report to the next General Synod a plan for the organization of the young people of the Church. The Synod expressed its approval of the growing interest and increased charities of the Church in behalf of the poor and afflicted, and, declaring that it recognized the right of women to the order and work of deaconness, recommended "the appointment of ladies qualified for this work in such congregations as may feel themselves ready to move in this line of Christian activity." A committee appointed at the previous General Synod to prepare an answer to the question sent up by one of the classes—"whether it is permissible to depart from the mode of baptism which has prevailed in the Reformed Church"—presented a report in which the question was defined as meaning, "Should a minister of the Reformed Church administer baptism by immersion?" and after reviewing the law and course of the Church, recommended the answer, which was adopted by the Synod, "that ministers are required to observe the mode of baptism which has for centuries prevailed in all the historic branches of the Reformed Church." The Synod protested against the purpose of opening the Columbian Exposition on Sunday "as a violation of the Christian sentiment of the American people and of the congressional legislation," and it decided by resolution that it individually or collectively would take no interest in the religious congress in connection with the fair if the doors were open on Sunday. A committee was appointed to consider the overture of the Presbyterian Church in regard to closer union and to make arrangements for carrying into effect a plan for such union. A banquet was given during the meetings of the General Synod in celebration of the one hundredth anniversary of the autonomy of the Church.

The gradual disappearance of the German language from the proceedings of the General Synod is remarked. While at the General Synod of 1869 nearly all the German ministers spoke in their native language, at the General Synod of 1890 very few speeches were made in German, and at the present General Synod "there seemed to be no disposition on the part of any to speak in German."

III. United Reformed Churches in the Netherlands.—A union has been effected between the two Free Reformed Churches in the Netherlands, the Christian Reformed Church, which separated from the state Church in 1834, and the Doleerenden, which separated in 1886, and between which no doctrinal differences existed. The first formal steps toward the union were taken in 1892, when the synods of both Churches met at Amsterdam, agreed upon, and effected union. The work was completed at a meeting of the United Synod held at Dort, Aug. 27, 1893. The subject of union of the two theological seminaries—that of Kampen and the

Theological Faculty of the Free University in Amsterdam—was placed in the hands of a committee, to report at the next session of the General Synod, to be held in 1898. The General Synod comprises about 700 churches.

REORGANIZED CHURCH OF JESUS CHRIST OF LATTER-DAY SAINTS, a church organization incorporated under the State statutes of Illinois and Iowa. It is represented in nearly all the States and Territories of the Union, in parts of Europe, Australia, and the Sandwich and Society Islands. The name Latter-Day Saints finds its special origin or significance among those who trace their religious convictions to the movement that arose in New York State about sixty years ago under the instrumentality of Joseph Smith.

At the time of his death there arose aspirants for leadership which rent the Church into a number of factions, among them being Brigham

JOSEPH SMITH.

Young, who led his portion to the Territory of Utah. The Reorganized Church of Latter-Day Saints was founded by members of the original organization that remained in Illinois and adjoining States, who rejected the claims of such leaders as Young and gathered around the standard of Joseph Smith, son of the prophet. It maintained as its sacred text-books and standard the Bible, the Book of Mormon, and the Doctrine and Covenants. The Book of Mormon is considered as auxiliary to the Bible, and not as superseding it. The Doctrine and Covenants contains reputed revelations through the prophet Joseph Smith, relating principally to church organization and government.

The Reorganized Church, in thus claiming authority for these books, made a marked distinction between themselves and their fellows who departed from them, who took the ground that

"the living oracles" (meaning their priesthood) should be the standard. Each of the books condemns polygamy. The Book of Mormon most emphatically condemns it in the following language: "There shall not any man among you have save it be one wife, and concubines he shall have none; for I the Lord delighteth in the chastity of women." In a suit entered in the Court of Common Pleas in Lake County, Ohio, the following verdict in favor of the Reorganized Church was rendered: "And the Court do further find that the plaintiff, the Reorganized Church of Jesus Christ of Latter-Day Saints, is the true and lawful continuation of, and successor to, the said original Church of Jesus Christ of Latter-Day Saints, organized in 1830, and is entitled in law to all its rights and property." There is now pending a suit in the United States Circuit Court of Western Missouri, touching some property in that State. The point of law governing in such cases is, that in the event of dissensions arising in an incorporate body, those holding to the original principles of the body are entitled to the rights of legal successorship.

As early as 1863 this Church sent as missionaries to Utah, to combat what they considered the heresy of Young, E. C. Briggs and A. McCord, whose first meetings were held in the parlors of Mrs. Waite, whose husband was at that time Chief Justice of the United States Court in the Territory of Utah.

The Book of Mormon is held to be a record of the ancient inhabitants of America, principally of their religious affairs. Nearly everything that has been published about it rests upon the claims that a manuscript written by Rev. Solomon Spaulding was obtained by Smith and his confederates after the death of Spaulding, and worked over into the Book of Mormon. But the finding of Spaulding's original manuscript by President Fairchild, of Oberlin College, in 1885, settles that phase of the question. President Fairchild, in an article in the "Bibliotheca Sacra," says: "The theory of the origin of the Book of Mormon in the traditional manuscript of Solomon Spaulding will probably have to be relinquished. That manuscript is doubtless now in the possession of Mr. L. L. Rice, of Honolulu, Hawaiian Islands, formerly an antislavery editor in Ohio, and for many years State printer at Columbus. . . . Some other explanation of the Book of Mormon must be found."

The Saints maintain a belief in present revelation not only to the prophet, but to any of its membership, according to their needs. Revelations to the Church that affect the body come through the head of the organization, and are binding only as they are approved by the Church by "common consent." Each quorum or suborganization have ample opportunity to discuss, reject, or otherwise act upon reputed revelations, after which they are submitted to a general conference, which is a representation by delegation of the entire membership. An established rule to govern in such action is that new revelations must be in harmony with the law, the standard books, the Bible, the Book of Mormon, and the Doctrine and Covenants. Their organization includes apostles, prophets, evangelists, pastors, and teachers. Ephesians, iv, and I Corinthians, xii, 28, is the Bible basis for their organic form.

The apostolic powers are vested in a first presidency composed of 3, a quorum of 12 apostles, and 7 quorums of seventies. The local officials are elders, priests, teachers, and deacons. There is also a body composed of 12 high priests called a High Council, who are the highest judicial body in the Church. The duties of these several officials are defined in detail in the Doctrine and Covenants. The temporal and financial departments are under the management of the bishop and his counselors, who have subbishops throughout the Church.

The finances are chiefly for the support of the families of the missionaries and others who give their entire time to the service of the Church, as also for the care of the poor. There are no salaried ministers among them, they claiming that the gospel is "without money and without price," and that they have not the right to make merchandise of it.

Their headquarters are in Lamoni, Iowa, where they have a printing establishment and book bindery. The "Saints Herald," the Church organ, "Zion's Hope," a paper for the young, and "Autumn Leaves," a monthly, are published there.

The numerical strength is something over 30,000. Last year's report at the general annual conference gives an increase by baptisms of 3,069, which is larger than in any previous year. There is in process of erection at Lamoni a college, and also a home for the poor ministers.

RHODE ISLAND, a New England State, one of the original thirteen, ratified the Constitution May 29, 1790; area, 1,250 square miles. The population, according to each decennial census, was 68,825 in 1790; 69,123 in 1800; 76,931 in 1810; 83,015 in 1820; 97,199 in 1830; 108,830 in 1840; 147,545 in 1850; 174,620 in 1860; 217,353 in 1870; 276,531 in 1880; and 345,506 in 1890. Capitals, Newport and Providence.

Government.—The following were the State officers during the year: Governor, D. Russell Brown, Republican; Lieutenant-Governor, Melville Bull; Secretary of State, George H. Utter; General Treasurer, Samuel Clark; State Auditor and Insurance Commissioner, Albert C. Landers; Attorney-General, Robert W. Burbank; Railroad Commissioner, Edward S. Freeman; Commissioner of Public Schools, Thomas B. Stockwell; Chief Justice of the Supreme Court, Charles Matteson; Associate Justices, Pardon E. Tillinghast, John H. Stiness, George A. Wilbur, Horatio Rogers, and William W. Douglas.

As the May session of the Legislature this year was adjourned by the Governor to January, 1894, before the returns of the April election were canvassed, the six officials first above named held over after the expiration of their term in May till the close of the year.

Finances.—For the year 1893 the State treasury statement is as follows: Balance on Jan. 1, 1893, \$100,007.96; total receipts, \$1,338,419.72; total payments, \$1,243,578.37; balance on Jan. 1, 1894, \$194,849.31. While there has been an increase of \$200,220.32 in the annual receipts over the figures for 1892, the yearly expenditures have only increased to the extent of \$129,446.84, of which about \$50,000 may be considered to represent extraordinary appropriations.

The funded State debt on Jan. 1, 1893, was \$1,283,000, of which \$584,000 was paid in July

from the sinking fund, leaving \$699,000 outstanding at the close of the year. As the State then had in its sinking fund more than enough funds to meet this liability, its indebtedness will be seen to be only nominal. In the near future, however, a new debt will be created by the issue and sale of State-House construction bonds, authorized by the Legislature this year.

Legislative Sessions.—The General Assembly, elected in 1892, convened at Providence on Jan. 31, and adjourned on May 26. An important result of the session was the passage of an act defining with precision the duties of the Secretary of State in making up the list of members of the General Assembly, declaring who shall take part in the organization thereof, and prescribing the manner in which such organization shall be effected. Another act regulates the proceedings in grand committee. It declares that the grand committee shall consist of a majority of the members of the Senate and a majority of the members of the House duly assembled, pursuant to an invitation from one of said bodies accepted by the other, the acceptance being communicated by message to the body in which such invitation originated. The method of ascertaining and declaring a quorum therein, of recording the proceedings, and of taking the vote, is prescribed. All business therein is forbidden, except such as is specified in the invitation. By another act a commission was appointed to select a site in the city of Providence for a new State House, and to erect a structure thereon. For this purpose the State Treasurer was authorized to raise money by the issue and sale of 4-per-cent. State bonds or scrip to an amount not exceeding \$1,500,000, payable in not over forty years from date.

A constitutional amendment providing for plurality elections for State, city, and town officers was proposed and transmitted to the next General Assembly for concurrence.

Other acts of the session were as follow:

For supplying pupils in the public schools with free text-books and school supplies.

Providing for police matrons in cities.

Amending the law regulating weights and measures.

Prohibiting the carrying of concealed weapons.

Providing a new law for the commitment and care of the insane.

Providing a general law for incorporation of companies.

Authorizing cities and towns to provide by ordinance for the punishment of indecent intoxication.

To prevent the introduction of infectious diseases.

Making the first Monday in September a holiday, known as Labor Day.

Appropriating money for the purchase of a camp ground for the State militia.

Increasing the tax on savings banks from 25 to 40 cents on each \$100 of deposits and of reserved profits.

The General Assembly chosen at the April election assembled at Newport on May 30. The roll of members, as prepared by the Secretary of State, gave the Senate 23 Republicans and 14 Democrats, and the House 40 Democrats and 32 Republicans. A majority of 1 in grand committee was thereby secured to the Republicans. But at the opening session the Democrats, having control of the House, proceeded to unseat the hold-over Republican member from James-

town and to seat a Democrat in his place, on the ground that certain votes cast in the April election for the Democratic candidate had been erroneously rejected in the count, and that these, if counted, would give the latter a majority. They then unseated the hold-over Republican member from Westerly, on the ground of his election to the Senate, leaving a vacancy in the representation from that town. By these tactics they secured 41 members of the House and a majority of the grand committee. Thereupon, on the third day of the session the House sent an invitation to the Senate to join with it in grand committee for the purpose of canvassing the returns of the April election and declaring the result. This the Senate refused to do, on the ground that the House, by unwarrantable action, had changed the political character of the grand committee. There being no choice for State officers by the people in the April election, the duty of selecting them would devolve upon the grand committee, as provided by the Constitution, and for this reason its political character became important. Before refusing to meet the House, the Republicans had carried through the Senate a resolution of adjournment to January, 1894, which the House, upon its reception, laid upon the table. The Senate then certified to the Governor that a difference existed between the two Houses as to the date of adjournment, and, in accordance with section 6 of Article VII of the State Constitution, he issued his order adjourning both Houses till the last Tuesday of January, 1894. The House refused to recognize this order, but, continuing in session, passed an order submitting to the State Supreme Court the following questions:

1. Has the Senate the constitutional power at the May session to pass a resolution of adjournment for a longer period than two days until after it has joined with the House of Representatives in grand committee, request having been made to the Senate by the House of Representatives to join in such grand committee for the purpose of counting and declaring the votes cast for general officers at the preceding April election?

2. In case a resolution of adjournment to the city of Providence to the fourth Tuesday in January following should have been adopted by the Senate before joining the House of Representatives in grand committee at the annual May session, for the purpose of counting and declaring the votes cast for general officers at the preceding general election, should not have been acted upon by the House of Representatives, does such a state of things constitute a "disagreement" on the subject of adjournment, which confers upon the Governor the power to adjourn the General Assembly under section 6, Article VII, of the Constitution?

3. Can the General Assembly at the May session be adjourned by the Governor, under the power conferred upon him by section 6, Article VII, of the Constitution, until after the two Houses have joined in grand committee, for the purpose of counting and declaring the votes cast for general officers at the preceding April election?

An answer to these questions was given by the court on Aug. 12. The first and third questions were answered in the affirmative, while upon the second no direct decision was given, the Court holding that the Governor was sole judge of what constituted a disagreement, and that his action could not be reviewed by the Court. The Democratic majority of the House had, meanwhile,

kept up its sessions from week to week, but on Aug. 17, in view of the opinion of the Court, they decided to adjourn to the time fixed by the Governor.

The only important action taken by the two Houses concurrently at this session related to the plurality election amendment to the State Constitution which was proposed at the January session. This amendment was concurred in, and provision was made for its submission to the people on the fourth Tuesday of November.

Education.—During the year the sum of \$1,332,414.83 was expended for education, of which \$300,371.15 was devoted to building and equipment. Of this total there was drawn directly from the State treasury \$274,476.79, and the remainder was derived from the treasuries of cities, towns, and districts.

The number of children enrolled during the year in public schools was 53,695, an increase of 958 over 1892. In addition to this number, 13,660 in 64 private institutions.

The most important events of the educational year were the completion of the Manual Training School in Providence, and the occupancy by the Rhode Island School of Design of its new quarters on Waterman Street, in Providence, which was the generous donation of a public-spirited citizen.

The new State establishment known as the Institute for the Deaf, in Providence, was dedicated on Feb. 21. It began the first year with 52 pupils. The cost of maintenance during the year was \$13,315.94.

There are at the Perkins Institution for the Blind, at South Boston, and its kindergarten, in Jamaica Plain, 9 boys and 11 girls supported by the State.

At the School for Feeble Minded, in Waverly, Mass., there are 6 boys and 5 girls.

Charities and Prisons.—The number of inmates at the State institutions on Dec. 31 was as follows:

INSTITUTIONS.	Men.	Women.	Total.
House of Correction.....	290	57	347
Asylum for Insane.....	284	296	580
Alms-house (including boys and girls)...	120	145	265
Prison.....	169	1	170
Providence County jail.....	249	18	267
School for boys.....	250	...	250
School for girls.....	20
Total.....	1,529

The building for the insane is finished and occupied, but it will only answer present requirements. Temporary barracks for about 150 men are being constructed to relieve the overcrowded condition of the Providence County jail.

Militia.—The returns of the active militia at the close of the year are as follow: Commissioned officers, 170; noncommissioned officers, 329; musicians, 62; privates, 915; total, 1,476. The number of men available in the State for militia service is 130,566. The expenditures for military purposes in 1893 were \$38,739.

Banks.—The deposits in the institutions for savings on Nov. 16, 1893, amounted to \$69,053,724.17, distributed among 130,610 depositors. The deposits in the trust companies, participa-

tion account, on that date amounted to \$7,959,708.45, and the number of depositors was 5,180. These figures show a decrease of \$853,268.40 in savings-bank deposits for the year, and a decrease of 11,882 depositors. But the decrease of deposits is due to the receivers of the Franklin Institution for Savings and the Cranston and Union Savings Bank declaring their final dividends. When this withdrawal is credited to the year's account the statement of savings in banks stands as follows: Increase in deposits for year ending Nov. 16, 1893, \$96,245.14; decrease in depositors, 391.

Political.—On Feb. 22 the Prohibitionists met in State convention at Providence and nominated Henry B. Metcalf for Governor, Jonathan Larkin for Lieutenant-Governor, Elisha T. Reed for Secretary of State, B. E. Helme for General Treasurer, and J. A. Williams for Attorney-General.

The Democratic State Convention was held at Providence on March 21, and resulted in the nomination of David S. Baker, Jr., for Governor, Dalton E. Young for Lieutenant-Governor, John J. Heffernan for Secretary of State, John G. Perry for General Treasurer, and Clarence A. Aldrich for Attorney-General.

The platform urges reform of the State Constitution, so that a plurality vote may elect; and declares that the executive, legislative, and judicial departments of the State should be separate from and independent of each other; that cities and towns ought to have fair and equitable representation in the General Assembly; that the duration of that body should be limited; and that the pay of its members ought to be increased, and special legislation as opposed to home rule forbidden.

On the same date the Republican State Convention met in the same city and renominated Gov. Brown and Treasurer Clark. For Lieutenant-Governor, Edwin R. Allen was nominated; for Secretary of State, Charles P. Bennett; for Attorney-General, Edward C. Dubois. The platform includes the following declarations:

We recognize the desirability of making such amendments to the Constitution as will facilitate the election and qualification of State officers, decrease the number of elections, allow the creation of non-partisan returning boards, and will enable a more businesslike administration of the Government by clearly defining the responsibility and duties of the several departments.

We charge the Democratic party with insincerity in its alleged desire for constitutional changes, as evidenced in its attitude toward the biennial-election proposition last November.

With a view to strengthening and improving the public-school system of this State, we advocate the substitution of the town for the district plan of organization, the furnishing of free text-books and supplies, and the adoption of such regulations as will promote a higher standard of qualification for teachers, and entitle them to increased remuneration.

We sympathize with the efforts of labor organizations toward the reduction of hours of toil and the better protection of life and limb, and we will cordially assist them in their endeavors to such an extent as will not embarrass the legitimate operations of our merchants and manufacturers in competition with those of other States.

We recommend the adoption of legislation for the purpose of stimulating and fostering the agricultural industry of this State, and the enactment of laws that

will provide for our fishermen the same protection accorded those of neighboring States.

At the April election there was no choice by the people for any of the State officers, no candidate having a majority of the votes cast. For Governor the vote, as announced unofficially, was: Baker, 22,015; Brown, 21,880; Metcalf, 3,265. At the same election members of the General Assembly were voted for, but there was no choice in many of the districts, and a second election became necessary therein. At these by-elections the Democrats were generally successful, securing control of the Lower House, while the Republicans retained their ascendancy in the Senate. An election was held in the two congressional districts of the State on the same date as the State election, there having been no choice by the people in the November preceding. At this second trial, a plurality only being necessary to elect, both districts were carried by the Democrats.

On Nov. 28 a special election was held to determine whether the plurality election amendment, which had passed two preceding Legislatures, should become a part of the Constitution. The vote was overwhelmingly in favor of the amendment, and on Dec. 4 Gov. Brown announced its adoption. This change will put an end to by-elections, and to many complications that have fostered political strife in the State.

ROMAN CATHOLIC CHURCH. The golden jubilee year of Leo XIII will pass into history as one of the most felicitous for the Church in this generation. The two hundred and sixty-third successor of St. Peter appeared in St. Peter's on Feb. 19, the fiftieth anniversary of his consecration as Archbishop of Damietta, before an audience of 60,000 persons, in which were included contingents from all parts of the globe. He gave his benediction in a remarkably clear voice, and for hours after the pontifical mass continued to receive the people and reply to addresses, at the end appearing very little the worse for the ordeal. The scene is described as the most enthusiastic and impressive witnessed in Rome in the memory of living men. The 400 church bells rang during the morning, and at night St. Peter's basilica was lighted for the first time since 1870. Congratulatory messages were received from the head of every Government, with the single exception of the Italian, and week after week throughout the year saw pilgrimages which the Holy Father invariably received and addressed in the Vatican. The largest bodies of visitors were composed of French, Spanish, and Swiss workingmen. One of the most remarkable incidents was the visit of Emperor William of Germany, who had a protracted interview with the pontiff, and signalized the occasion by giving a banquet to Cardinal Ledochowski, the prelate who owes his prominence in the papal court to his imprisonment and exile under the Bismarckian era. The offering of Peter's Pence on this occasion was about \$2,000,000, of which the American contribution amounted to \$120,000.

An unprecedented distinction was accorded an American composer, Dr. Frank G. Dossert, by the Pope on the feast of St. Joseph, a *messe solonelle* in honor of the jubilee being produced in St. Peter's before a vast congregation, in which were

Verdi, the American students, the American residents without distinction as to religion, the foreign embassies, and the papal court. The voices were the finest in Rome, Dr. Dossert directing in person by the courtesy of Prof. Meluzzi, the veteran organist of St. Peter's. This is the first time that any composer other than an Italian has enjoyed such a privilege, and it marks also the first European recognition of American musical genius. The expense of the production was defrayed by the following committee: Austin E. Ford, chairman; Hon. William R. Grace, Rev. Charles H. Colton, Augustive Daly, Frederick R. Coudert, Judge Morgan J. O'Brien, Judge J. F. Daly, James S. Coleman, Patrick Farrelly, George Ehret, Henry Amy, John B. Manning, Peter Doelger, John A. McCall, Rev. J. H. Hayne, Ferdinand Levy, Gov. Roswell P. Flower, Rev. P. M. Corr, and Mrs. Theodore Havemeyer, Mrs. Eugene Kelly, Mrs. J. M. Hecker, and Mrs. T. A. Emmet—all of New York. A banquet was afterward tendered Mr. Dossert at the North American College, and a reception given him by Queen Marguerite. Pope Leo, in congratulating the composer, said that his love for America had grown with his years, that his hope was to see Italy equally happy and free, and that, in departing from the rule in inviting him to perform the mass in Rome, he had desired to emphasize the character of the Church as the patron of art, as well as to encourage its development in the New World, where, in time, he believed it would flower most beautifully.

A review of Leo's pontificate to March 8 elicited the facts that he had erected 1 patriarchate; 27 archdioceses, 14 of which were bishops' sees; 77 new bishops, 1 delegation, and 47 vicariates-apostolic; and 18 new prefectures—a total of 177 new titles, including the 53 cardinals.

Beatifications.—Three beatifications crowned the year, viz.: Francesco Saverio Bianchi, Barnabite father, Jan. 21; Gerardo Majella, lay brother, Congregation of the Most Holy Redeemer, Jan. 29; Antonio Balducci, Society of Jesus, April 16.

The Sacred Congregation of Rites, by decree of Dec. 17, fixed the patronal feast of the Pious Association of the Holy Family for the third Sunday after the Epiphany.

Vatican and Quirinal.—The relation between the Church and the Italian Government became more strained. It reached its intensity on the elevation of Cardinal Sarto, Bishop of Mantua, to the see of Venice by the papal bull of June 17. This was held to be a violation of the right of the Crown of Italy to this piece of ecclesiastical patronage, claimed by it as the representative of the former Republic of Venice, which became extinct in 1797. A suspension of the royal exequator and stipends left 30 Italian sees without their pastors, with a promise of the ensuing consistory adding to the number, as the Pope absolutely refused to recognize the exclusive right claimed by the civil power. There was interference with the Catholic press by the ministry, nearly all the leading papers suffering suspension.

The principal encyclical of the year was that on the study of the Scriptures, Nov. 18, in which the Pope urges upon ecclesiastics the mastery of the Oriental languages necessary to a proper un-

derstanding of the sacred text, explains the Catholic doctrine of inspiration, and shows the disposition with which the subject should be approached.

The Eucharistic Congress at Jerusalem (May 12-20), under the presidency of Cardinal Langenieux, was welcomed by the schismatical Churches of the East with an unlooked-for warmth, and substantial progress was reported to the Pope toward the ultimate reunion of those Churches with Rome.

The Benedictines gathered in Rome by order of the Pope, April 18, to witness the reinstallation of their order as a favored institution of the Church, and the laying of the corner stone of the new International College of St. Anselm. Six hundred abbots were present. Leo XIII referred to the order's vast achievements for learning and religion in the ages gone by, and urged that the work of placing it once more in the forefront be taken up in earnest. The Franciscans have taken possession of the Borghese Palace as headquarters of the order.

The United States.—The development of the Roman policy in the United States was the marked feature of the year. The coming of Archbishop Satolli in October, 1892, in the capacity of an appellant judge with extraordinary discretion, caused considerable discussion, and a disposition to resent his intervention as an unwarranted interference in the conduct of American ecclesiastical affairs was manifested from the outset. Newspaper controversy enlivened the earlier part of the year, and in both the daily and Catholic press the decision of Mgr. Satolli restoring Dr. McGlynn, the support of Father Corrigan as against Bishop Wigger, the order annulling and superseding those of Bishop Matz and Bishop Wigger, which had in the past prohibited priests from ministering the sacraments to children attending the public schools, were freely criticised. In the Archdiocese of New York so much feeling was exhibited and the name of Archbishop Corrigan was so familiarly used as a leading spirit in the opposition to the papal representative, that it became necessary for his grace to make a public pronouncement of his loyalty, which was done in the presence of Mgr. Satolli and a distinguished audience in St. Patrick's Cathedral. This effectually disposed of the dissensions which were fast dividing the Church into two hostile camps, and thenceforward a more peaceable tendency developed.

The order from Rome silencing opposition to Mgr. Satolli was evidence of the Pope's determination to sustain his delegate. This was followed six days later (Jan. 14) by a vatican decree enhancing the title of the Monsignor, and permanently establishing the American apostolic delegation. Rev. Dr. F. Z. Rooker, Vice-President of the American College at Rome, who had been appointed secretary to the delegate *pro tempore*, was succeeded by Mgr. Sherrati, who became permanent secretary and chancellor. The rescript from Rome dated Jan. 24 declared that the growth and good of religion here demanded the action which the holy see had taken for its "special care and provision," and defined the great power of the delegate in these words:

"We command all whom it concerns to recognize in you [Mgr. Satolli], as apostolic delegate,

the supreme power of the delegating pontiff; we command that they give you aid, concurrence, and obedience in all things, receiving with reverence your salutary admonitions and orders. Whatever sentence or penalty you shall declare or inflict duly against those who oppose your authority, we will ratify, and, by the authority given us by the Lord, will cause to be observed inviolably until condign satisfaction be made, notwithstanding constitutions and apostolic ordinances, or any other to the contrary."

Mgr. Satolli formally opened his headquarters in Washington, not far from the Catholic university. His most important ruling of the year, perhaps, was that of Feb. 2 against Bishop Wigger. The bishop had closed St. Thomas's Church, Bayonne, N. J., built by an English-speaking congregation, which was thus compelled to contribute to the support of a weaker neighboring church in which the German tongue was used. An order to reopen St. Thomas's was issued with the additional provision that all sermons and instructions be in English—a confirmation of the Vatican policy to discourage the perpetuation of racial distinctions in the American Church.

The School Controversy, which had raged for a year, received a check in June by a papal letter addressed to Cardinal Gibbons and the hierarchy. It ordered a cessation of acrimonious discussion, recommended conciliation, commended the decrees of Baltimore extending the parochial school system, where feasible, while inferentially upholding the compromise of Archbishop Ireland with the local authorities, and counseling common ecclesiastical and civil action for the cultivation of the arts and sciences and the moral improvement of the citizen. Hostility to the public school, *per se*, is discountenanced, and the rights of parents in the matter of its use are not to be questioned. Mgr. Satolli visited the Northwest, receiving public ovations along the line to the Pacific. At Stillwater and Faribault he inspected the famous schools whose names have been associated in the educational discussion, and expressed himself delighted with what he saw. Later in the year the Faribault plan was discontinued in the city of its birth, owing to a disagreement over the appointment of Protestant teachers in the schools turned over to the school board by the Catholics. Archbishop Ireland, however, continued to extend the principle elsewhere throughout the diocese of St. Paul, and made considerable progress notwithstanding the aggressive opposition of the anti-Catholic American Protective Association. An effort to incorporate the denominational schools in the public system, originating with the Catholic clergy, was bitterly opposed by the Protestant ministers of New Jersey, and finally defeated on a close vote in the Legislature. A similar measure, designated as the Spellissey bill, was draughted in New York, but on the disapproval of Archbishop Corrigan it was discredited. Numerous arrangements looking to a conformity of parochial and public education occurred in various parts of the West and Southwest, probably more than in any one year in the history of the country.

Statistics of Growth.—The hierarchy at the end of 1893 (including Mgr. Satolli), showed a

total strength of 93, against 88 the previous year. There were 4 new archbishops: the priesthood increased from 9,338 to 9,717; the churches, from 8,433 to 8,729; the chapels, from 3,920 to 5,704; Catholic schools, from 3,585 to 3,732, with an increase of pupils from 781,885 to 765,988. The archdiocese of Boston gained 51 schools in the year. There are 8 universities, 25 secular and 61 regular seminaries, 179 high schools for boys, and 732 academies for girls. There were 644 academies the year before. Charitable institutions increased from 647 to 753. New York leads in population with 800,000; Boston, second, with 575,000; Chicago, third, with 550,000; Philadelphia, (410,000), fourth; New Orleans (300,000), fifth.

The Papal Exhibit at the World's Columbian Exposition, Chicago, attracted as much attention as anything on the grounds. The 17 principal objects were displayed with the Columbus relics in the Convent of La Rabida, and were guarded by United States marines day and night.

The Catholic Educational Exhibit covered 30,000 square feet of the Liberal Arts building. It was opened June 25, under the direction of Bishop Spaulding and Rev. Brother Maurelian. Twenty dioceses and 1,200 institutions were represented.

Congresses.—Catholic participation in the World's Parliament of Religions was most generous, 27 representatives speaking in 17 different day sessions, besides Sept. 12, which was designated as "Catholic day."

Catholic congresses were never so numerous as in 1893. Chicago was the meeting place of the principal ones. The first was the National Convention of Catholic Women, May 18, Mrs. Alice Timmons Toomey presiding. Plans for the improvement of woman's condition through organization and education were discussed, and papers designed to encourage it were read by Miss Eliza Allen Starr, Miss Ellen A. Ford, Miss Emma Cary, Frances Costigan, Miss Lily Alice Toomey, Miss Mary Josephine Onahan, M. A. B. Maher, Sarah Moore, and Janet E. Richards. Eleanor C. Donnelly and Mrs. Margeret M. Halvey contributed original poems. A Catholic Woman's National League to promote temperance and charitable work among the sick and poor, and advance the kindergarten schools, was one of the results of this congress. The Catholic Total Abstinence Convention was held in June.

The second American Catholic Congress was held in September at the Art Institute, Chicago. Its proportions were so vast that its organizer, Hon. William J. Onahan, found it impossible to adhere to the original programme. It practically resolved itself into a series of huge mass meetings. Beginning Sept. 4 there were day and evening sessions ending with Sept. 8. Sept. 9 being Catholic Congress day on the fair grounds. Judge Morgan J. O'Brien, of New York, was elected permanent chairman. The papers dealt with the mission and character of Columbus, and the influence of the Church on American institutions, woman, education, labor, etc. One by M. T. Elder, New Orleans, placing the Catholic loss by proselytism and absence of precautions at 20,000,000, caused much adverse criticism. The resolutions favored the autonomy and independ-

ence of the Pope, opposed the secularization of the Sabbath, proclaimed that "only the school bell and the church bell can prolong the echo of the liberty bell," and concluded with the words of Mgr. Satolli: "Forward! in one hand the gospel of Christ, and in the other the Constitution of the United States."

The fourth Colored Catholic Congress was held in the same building at the same time, and the report of the committee appointed to inquire into the question of discrimination among the clergy on account of color, especially at the South, upheld the charge, and an address was adopted protesting against such departure from the teachings of the Church and demanding everywhere the same consideration and equality as exhibited by the Catholic Congress in making the colored convention a part of itself. During the same week conventions of Catholic editors, Catholic young men's unions, German Catholic guilds, and St. Vincent de Paul conferences were also held.

Catholic Summer School.—This project ceased to be an experiment and became a permanency after a very successful session at Lake Champlain extending from July 15 to Aug. 6. The New York State Board of Regents granted it a charter Feb. 9, classifying it in the system devoted to university extension. Land has been secured in the neighborhood of Plattsburg, and a \$30,000 building fund is being raised.

The Redemptorist Order, denied a foothold in the diocese of Brooklyn under Bishop Loughlin, secured the permission of Bishop McDonnell, his successor, to build its first house in South Brooklyn.

Important hierarchal changes were made May 18 in the appointment of Bishop Kain, of Wheeling, as coadjutor to Archbishop Kenrick, of St. Louis; the promotion of Bishop Hennessy, of Dubuque, to the rank of archbishop, and the translation of Bishop Burke, of Cheyenne, to the see of St. Joseph, and Bishop Rademacher, from Nashville to Fort Wayne.

The Rev. Edward McGlynn, D. D., completed his reconciliation with the Roman authorities by a visit to the Vatican in June.

Bishop McNierney, of Albany, was made a member of the State Board of Regents by the New York Legislature, the first direct recognition of the Catholic hierarchy in the membership of that body.

Jubilees.—The centenary of the founding of the New Orleans Cathedral was celebrated April 25. Cardinal Gibbons's silver jubilee, which fell on Aug. 16, was honored magnificently Oct. 18. The other silver jubilees celebrated were: Bishop McCloskey, Louisville, May 24; Bishop McQuaid, Rochester, and Bishop O'Hara, Scranton, July 12; Bishop Mullen, Erie, Aug. 2; Bishop Becker, Savannah, Aug. 16; Bishop Hogan, Kansas City, Sept. 13; Bishop Ryan, Buffalo, Nov. 8. Bishop Waterson's priestly jubilee was celebrated Aug. 8. Great demonstrations were occasioned by the golden jubilee of the dioceses of Pittsburg and Little Rock.

France.—A better state of feeling between Church and state and the priests and people pervaded France during 1893 than in many years. There were but a few discordant inci-

dents. One was the insistence of the Government on a say in the naming of the successor of Cardinal Lavigerie and the Vatican's denial of that right unless provision was made by France for the support of the African hierarchy. The matter remains an open question. The neutral school policy was questioned by a great Catholic meeting at the Champs Elysées, Paris, and an organization was formed to restore religion as a necessary part of instruction in the free schools. Leo XIII, while favoring the public system and deprecating anything calculated to injure it, approved of the propaganda in so far as it aimed at the recognition of religion as the basis of morality.

The general policy of the Vatican toward the republic remained unchanged notwithstanding the powerful opposition of Cardinal Kopp in Germany, and the royalists in France. On the eve of the general election Leo XIII addressed another letter to the French bishops and people, urging an earnest interest in the duties of citizenship and a cordial support of the existing institution. One result of this was the largest popular vote, although Count de Mun, one of the most ardent supporters of the Pope's conciliatory policy, was among the defeated. The nucleus of a legislative Catholic Republican party was returned. Pope Leo announced to the French pilgrims that he would signalize his regard for France at the close of his jubilee year by canonizing Joan of Arc.

The French Government in April restored all the rights and stipends of 8 prelates who had been cut off in consequence of their avowals of hostility to the republic, making Archbishop Goutte-Soulard of Aix, who had been tried and fined for insubordination, the only exception. Cardinal Langenieux was in June made Archbishop of Rennes, and the Bishop of Bayeux promoted Archbishop of Lyons. A great Catholic congress was held in Besançon in March, at which the main topic of discussion was the labor question. It was resolved to organize clubs of Catholic workmen to counteract the anarchistic propaganda, with the encyclical of Leo XIII for a platform, such organizations taking the initiative in all movements for the improvement of social conditions. Count de Mun made an eloquent address, the theme of which was that such work carried on under the auspices of the Church, as it should be, would redeem France from infidelity and faction and save her for God and civilization.

Great Britain and Ireland.—Catholicity in England, according to the London "Court Journal," is receiving accessions from the Church of England, especially "the clergymen and literary men and women of some means, not in single files, but in battalions," and "there has not been a more decided movement toward Rome in years." The discussion on "Hell" caused by Prof. St. George Mivart's application of evolutionary theories to the subject, after involving nearly all the leading English-speaking theologians for more than a year, was finally ended by a Roman decree unfavorable to Mivart's articles, and their author, over his own name, in December, publicly acquiesced in the judgment.

The Census of 1891, completed and issued this year, shows an increase of Catholic priests in ten years of from 2,089 to 2,511.

The question of undenominational Christianity for the London schools was raised by the report of the Board Committee in November, and the Catholics decided to vote with the opposition to such a system in the elections a year hence, when the question will be submitted for decision. The hierarchy of England circulated petitions at the church doors in November in accordance with the decision to ask Parliament, in the name of the whole Catholic body, to settle the twenty years' agitation by granting Catholic schools their share of the education rate.

The Isle of Man, in October, passed a Catholic emancipation act.

Ireland celebrated the completion of St. Patrick's Ecclesiastical College, Maynooth, one of the finest structures in the world, this year, and substantial progress was made toward abolishing Protestant monopoly of university education. The amendment of the National School Board rules so as to admit the Christian Brothers' schools to the benefits of the state grants for Irish education, which was one of the conditions imposed by the Irish party to the passage of the Compulsory Education act, was postponed by Secretary Morley, and aroused a strong protest, which took the form of legislative obstruction, on the part of Mr. Sexton, M. P., with favorable result to the Brothers' institutions. Rt. Rev. Dr. Fitzpatrick, Lord Abbot of the Trappist Monastery of Mount Melleray, a position which he held for forty-five years, died Dec. 5, at the age of eighty-one. Among the other institutions founded by him was the monastery at Dubuque, Iowa.

British America.—The Catholic appeal to the Dominion Cabinet and the Supreme Court in favor of the disallowance of the Manitoba School act was pushed, on the ground that, apart from the provincial Constitution, the educational clause in the British North America act, guarantees the inviolability of the Catholic separate schools. The Manitoba majority government sets up that the clause does not apply to the province. A misunderstanding occurred in Ontario, in March, between the Irish and French population, the former claiming that presence of French children in their schools interfered with grading and efficiency. A compromise was effected, by which French children will not be excluded from the Catholic English-speaking schools unless the teachers so request. An investigation in the counties of Prescott and Russell, where there was much trouble, in 1889, over the language question, revealed the fact that a complete change had taken place in the French Catholic schools—of the 3,640 children 3,581 being taught English. In January M. Tarte was elected member for L'Islet on the educational issue, and on March 6 moved a resolution censuring the Cabinet for refusing to summarily disallow the Manitoba act of 1890 abolishing the separate schools. After a three days' debate the resolution was rejected—120 to 71. The school question developed in New Brunswick, the Protestants claiming that, through the action of the Catholic majority on the Board of Education in Bathurst, they are compelled to pay rates for the support of religious teachers in institutions which were formerly public schools. An investigation with a view to a proper adjustment of

taxes is under way. In Quebec a movement for the lay control of Catholic schools—4,615 out of the whole 5,618 in the province—developed.

Hon. Honore Mercier, ex-Premier of Quebec, on April 4 placed himself at the head of the movement for Canadian independence in a speech in which he declared either that or annexation to the United States was necessary to the preservation of the religious equality, language, and influence of French nationality. On June 25, the celebration of the two hundred and fifteenth year of the founding of Montreal, M. Mercier, in his French monument dedicatory speech, appealed for a union of French and other Catholics as a necessity to preserve their liberty and existence from English encroachment.

The sisters of Notre Dame suffered a severe loss June 8 by the destruction of their great educational convent of Ville Marie. It took four years to build the institution, of which only the boarding school was saved. Loss, \$1,500,000; insurance, but \$100,000.

Two law cases affecting Catholics came up in the Quebec courts, the first resulting in a decision early in the year that marriages between Catholics unsanctioned by the Church are invalid, the second being a judgment against Archbishop Fabre, of Montreal, in the action brought by the "Canada Revue," Sept. 25, for damaging its business interests through a pastoral boycott because the paper criticised the ecclesiastical tax exemption and tithe system.

Mayor Desjardines, July 30, refused to preside at a dinner to Italian war-ship officers in Montreal lest it might be taken as a countenance of the acts of the Government which has deprived the Pope of his temporal power. Leo XIII decorated him for his protest.

Germany exhibits a Catholic advance in every direction. The Center party manifested its power by defeating the Army bill and compelling an appeal by Emperor William and Caprivi to the country—although in so doing a division was caused—resolving the party into aristocratic and democratic elements. The democratic Catholic contingent made the most numerous showing in the subsequent June elections of any single party, and taken all together—Centerists, Government Centerists, Poles, Guelphs, Alsatians, etc.—the Catholics have the balance of power in the new chosen Reichstag. Cardinal Ledochowski advised the 19 Poles to throw in their lot with the Government in return for concessions, although all overtures to the Pope direct failed to secure any word of encouragement for the Emperor. Cardinals Hohenlohe and Kopp both favored the Government, but their exhortations proved futile with the people. The visit of Emperor William to the Pope in April helped on the cause of conciliation, but gained nothing for the support of the triple alliance. In December the Catholic party made a decided effort to secure the repeal of the last vestiges of the penal laws enacted under the Cultur-Kampf of 1872. Count Hompesch, as spokesman, made an able and conciliatory speech in favor of the return of the religious orders. "Socialists and anarchists," said he, "are free to preach the destruction of every social institution, and a Jesuit alone is expelled for teaching the word of God." The Opposition was weak, the ministry refraining from debate, and on mo-

tion—the Catholics being joined by the Social Democrats, the Alsations, Poles, and most of the Liberals—the first and crucial clause of the bill was passed by a vote of 173 to 136. The Protestant Conservatives deciding to reintroduce the scholastic law in favor of Christian education, the Catholics decided to support it, thus insuring its passage. The Center party entered a protest in the Reichstag against the inadequacy of Catholic representation in public office, especially in the Department of Worship, which is completely in Protestant hands. Of 10 councilors in Prussia, where the state nominates bishops and pastors, controls the Church property, passing upon the needs for new buildings and repairs for old ones, but one is a Catholic, the great Protestant military chaplain being chairman of the council.

Russia.—Official excesses marked the whole year, notwithstanding the Czar's friendly assurances to the Pope. Governors refuse to appoint priests to vacant posts on the plea that they are not wanted, with a view to eventually close the churches and disperse the flocks. The seminaries are threatened with civil inspection, the Bishop of St. Petersburg is prohibited from visiting in his diocese, and on April 8 Orzowski, one of the new governor-generals, warned the priests against intermeddling in politics, and, as a sort of emphasis, immediately afterward banished Father Zyworonck to Siberia for five years, and Father Endryk to Astrakhan for six years. The convent prison of Aglona, it is said, is full of exiled priests. In November 22 priests were exiled from the Vistula district, an attempt at rescue on the part of their flocks resulting in a wholesale massacre by the Cossacks. Much indignation was manifested at the Vatican over the report that the diplomatic negotiations between Pope and Czar indicated an abandonment of Polish national rights. Leo, in answer to the congratulations of the Polish pilgrims, took occasion to stigmatize these reports as mischievous. His first concern in all his dealings with Russia was for them. In July the Benedictine convent at Krone, in Lithuania, was closed by the Government, and the nuns carried off to a public institution in a neighboring city. The attempt to close a Catholic chapel in the same place in December was coincident with fearful Cossack atrocities. Male and female worshippers were ridden down, a score killed, 200 beaten to a jelly with the knout, and the town sacked. Gov. Klinkenburg, the responsible official, was transferred to another province, and, without further reference to the losses and injuries of the people, the concern of the St. Petersburg government ceased. The new orders of the Czar prohibit any bishop from writing to Rome except through the intermediary of the Imperial Chancellor, and any priest baptizing the offspring of a mixed marriage, or hearing the confession of a Uniate, is exiled to Siberia.

Turkey.—According to the announcement of Mgr. Azarian, Patriarch of the Armenian Catholics and ambassador extraordinary to the Pope during the jubilee festivals, under date of April 2, religious liberty there is an assured fact. The devotees of the Koran recognize Christianity as a true safeguard of the principle of authority, he says, and favor the spread of Catholicity in the empire on that score. The bishops, the 15

suffragans, of the patriarch, have civil jurisdiction in all their districts, and all questions of testaments, heritages, and contracts of marriage are under the jurisdiction of their tribunal. Not only is free exercise of religion guaranteed, but exterior manifestations of worship are respected; the streets and highways are open to processions; the crowds give honor to the Blessed Sacrament; and the schools, works, missions, and all religious institutions rise and prosper with the sympathy of the Government. The person of the Patriarch of Constantinople is surrounded with attention, his word is listened to in the most high places, and on more than one occasion he has been sent on diplomatic missions by the Sultan. Referring to all this, Leo XIII. on Feb. 21, praised "the benevolence of the sovereign and the deference of the imperial authorities, thanks to whom Catholics in Turkey owe the exercise of their religion." Recognizing the schismatic Armenians as also his children, the Pope has interceded for the amelioration of the civil conditions which make their lives a hardship. As a result of this intercession, one congregation of 10,000 souls has resumed its relations with Rome.

Austria presented the same unfavorable attitude as during the preceding year on the marriage and baptismal laws. The hierarchy vigorously resisted the civil interference in these matters. Advised by the Vatican, the protest promised to take the form of political opposition. The tendency of Government, however, was to insist upon its precedence over religious rights. The vacancy in the see of Agram, caused by the refusal of the Holy See to accept Mgr. Vaceticz, Emperor Joseph's choice, after a three years' dispute, has been finally settled by the surrender of the Emperor and the selection of a bishop acceptable to the Pope with an assurance of royal love and loyalty. Cardinal Vasury, Primate of Hungary and leader in the opposition to the Government, narrowly escaped assassination April 10. The dagger intended for the Cardinal was buried twice in his secretary. Great preparations were being made in the latter part of the year for the first Catholic Congress in Hungary. A meeting demanding the restoration of the Pope's temporal power was held in Vienna in February, and caused counter-demonstrations by its Italian opponents against the triple alliance. The feeling was allayed only by the Emperor sending the archduke as special envoy from his household to the royal wedding festivities in Rome in April.

Spain.—The first Spanish Eucharistic Congress was held at Valencia for four days, beginning Nov. 20, attended by thousands and presided over by Cardinal Sanz y Forrés, Archbishop of Seville. Its object was the revival of public and private devotion to the Holy Sacrament, and the encouragement of an eucharistic literature and scholarship. The second Congress will be held at Lugo, in 1897.

The restoration of the Convent of La Rabida and its return to the Franciscan order by the Spanish Government in honor of the Columbian celebration elicited a letter of thanks from the Pope in May.

Japan as a missionary field attracts the attention of the propaganda, and M. Corre, of the

Paris Foreign Missions, sends out a general appeal for assistance. The former nobility, he says, make the readiest converts. A hospital for lepers has been established at Golemba, and it overflows with patients, many of whom are radically cured by the treatment of the fathers.

China.—The persecution of the missionaries was allayed somewhat, owing to the demands of France and the measures of the Government, who levied the damages upon the districts where the mission houses were destroyed or looted in July.

Mexico.—The relations of Church and state are not so happy as formerly, owing to the disposition of political extremists to take advantage of the so-called reform laws restricting religious institutions such as convents. A question of personal liberty under these laws was brought before the courts in April in the case of Jesusa Lopez, a young woman arrested on the complaint of her brothers that she intended to violate the spirit of the law by entering a convent in Louisiana. The brothers were sustained by the courts. A disagreement has arisen between the Jesuits and the Archbishop of Mexico, the latter threatening to expel the order from his diocese. Archbishop Alarcón denies all sympathy with opposition to President Diaz, whom he declares is no enemy of the Church. Clerical influence with the state, he says, can be regained best through the arts of peace. "No real friend of either Church or state will engage in the work of fomenting discords." The Pope has ordered that the feast of the Virgin of Guadalupe shall be observed as a general feast in Mexico. Three new bishops—Dioza, Moza, and Gezambus—were consecrated during the year.

South America.—An apostolic delegate for South America in the person of Mgr. Lasagna, Bishop of Tripoli *in partibus*, was named in March. He is credited to all the governments without fixed residence, and has done splendid work in developing the missions of St. Francis de Sales, to which order he belongs. His main work, however, has been as arbitrator in the dispute between Ecuador and Peru, through which up to the end of the year war had been avoided.

British Honduras was erected into a diocese, and in April its first bishop was consecrated.

Chili was troubled with an agitation against clerical control of education. A few serious riots took place in Santiago. They were suppressed by the Government, and the matters of complaint are in fair way of amicable adjustment.

ROUMANIA, a constitutional monarchy in eastern Europe. There are 120 members in the Senate, elected by two electoral colleges for each district, and 183 Deputies, elected by three colleges. Carol I, a prince of the house of Hohenzollern-Sigmaringen, was elected and recognized as hereditary Prince of Roumania in 1878, and proclaimed King in 1881. In default of a direct heir his nephew, Ferdinand of Hohenzollern, born in 1865, was appointed Crown Prince in 1889 with the approval of the Senate. Ferdinand married Princess Marie of Edinburgh, who, on Oct. 15, 1893, gave birth to a son, Carol. The ministry in 1893 was composed as follows: President of the Council and Minister of the Interior, L. Catargi; Minister of Agriculture, Commerce, Industry, and Domains, P. P. Carp;

Minister of Foreign Affairs, A. Lahovari; Minister of Finance, M. Germani; Minister of Justice, A. Marghiloman; Minister of War, Gen. J. Lahovari; Minister of Public Works, C. Olanescu; Minister of Worship and Public Instruction, Take Jonescu.

Finances.—The revenue is estimated in the budget for the financial year 1893-'94 at 189,610,500 lei, or francs, of which 51,455,000 lei are derived from indirect and 28,665,000 lei from direct imposts, 45,700,000 lei from state monopolies, 28,453,000 lei from domains, 14,429,000 lei from public works, and 20,908,500 lei from other sources. The principal items of expenditure are 68,135,293 lei for the public debt, 40,424,072 lei for war, 23,869,645 lei for financial administration, 19,918,421 lei for public instruction, 17,176,897 lei for the interior, 6,302,348 lei for public works, 5,580,360 lei for justice, and 5,378,382 lei for domains. The capital of the public debt on April 1, 1893, was 1,032,519,125 lei, paying for the most part 4 and 5 per cent. interest.

Commerce.—The total value of the imports in 1892 was 380,747,296 lei, and of the exports 285,384,057 lei. Of the imports, Germany furnished 118,501,000 lei; Austria-Hungary, 89,356,000 lei; Great Britain, 84,090,000 lei; France, 80,911,000 lei; Belgium, 20,551,000 lei; Turkey and Bulgaria, 16,504,000 lei; and Russia, Switzerland, Italy, and Greece most of the rest. Of the exports, 120,584,000 lei were sent to Great Britain. 42,968,000 lei to Belgium, 33,236,000 lei to Germany, 31,566,000 lei to Austria-Hungary, 20,389,000 lei to Italy, 17,349,000 lei to Turkey and Bulgaria, 11,085,000 lei to France, and a small amount to Russia and other countries. The export of cereals, the only important product of the country, amounted to 251,900,000 lei in 1892. A new commercial treaty favorable to the importation of Roumanian grain into Germany was ratified in December, 1893.

The Army and Navy.—Personal military service is obligatory for all able-bodied Roumanians from the age of twenty-one. The period of active service is three years in the permanent army, four years in the territorial cavalry, and five years in the territorial infantry. The soldiers of the permanent army are drawn by lot, and the others are called out for exercises only twice a year. The peace effective for 1892 was 2,960 officers and 46,000 men, with 10,000 horses and 600 guns. The war strength of the army is 3,500 officers and 148,000 men, besides 50,000 trained men in the militia and Landsturm. There is a naval force on the Danube consisting of a flush-decked cruiser, 2 paddle-wheel dispatch vessels, 2 gunboats, 3 coast guards, 2 steamers, 4 sloop gunboats, and 5 torpedo boats, armed with 6 large and 59 small guns altogether, and manned by 96 officers, 25 mechanics, and 1,480 sailors.

Communications.—The merchant marine in 1893 consisted of 30 steamers, of 1,899 tons, and 84 sailing vessels, of 7,661 tons. The railroads belong to the state, which in 1893 had 1,568 miles completed and 343 miles begun, and 620 miles more were projected. The state telegraph system had a total length of 3,525 miles, with 7,915 miles of wire. The number of messages forwarded in 1892 was 1,592,525. The post-office handled 15,645,630 letters, 4,787,565 postal cards,

and 7,960,771 other pieces. The receipts were 3,650,123 francs, besides 2,498,919 francs from telegrams, and the expense of both services was 7,960,771 francs.

European Commission of the Danube.—The receipts of the International Commission created in 1878 for the regulation of the Danube were 3,381,445 francs in 1892, and the expenses were 2,235,067 francs. The surplus on hand, including reserve and pension funds, was 2,628,993 francs. The number of freight vessels that cleared the Sulina mouth during the year was 1,532, of 1,427,087 tons, of which 1,124, of 1,349,715 tons, were steamers. Of the total tonnage, 866,758 tons were British, 199,491 Greek, 82,804 Austrian, 78,075 Turkish, 50,048 Italian, 49,095 Norwegian, 39,177 French, 33,352 Russian, 26,285 German, and 3,602 Dutch, Spanish, Roumanian, etc. The export of wheat was 4,031,000; of rye, 575,000; of maize, 3,231,000; of barley, 1,215,000 quarters.

Legislation.—Among other measures that became law during the session that was closed in the beginning of June, 1893, were important reforms relating to local administration, to the clergy, and to popular education. A law regulating agrarian contracts, designed to alleviate the hardships and the discontent of the rural population, embodies principles which the Old Conservatives were strong enough to resist when they were in opposition, but but which Catargi now induced them to accept. Jonesco worked out a reform measure extending and organizing primary education. A bill dealing with the forestry, agricultural, and commercial schools was amended by Anti-Semites so as to restrict gratuitous instruction to Roumanian citizens, and to exclude foreigners from the industrial schools altogether. Carp objected strongly to the exclusion of foreigners and Roumanian Jews, who are also foreigners according to the law, though they are obliged to serve their time in the army, where they can not be promoted even to be noncommissioned officers. The Liberals, outdone in popular measures by the Junimists, allied themselves with the extreme Democrats, led by N. Fleva, who took advantage of a well-intended but complicated bill to equalize and regulate the municipal taxes on articles of consumption to start an agitation against the ministry that resulted in riot and bloodshed in Bucharest.

The town councils have raised a large part of the local revenues by imposing taxes on articles of food and drink brought in from outside. The ministry framed a bill prescribing maximum rates, and making the tax on consumption applicable also to articles, such as liquors, produced in the towns. The local tradesmen, excited by the harangues of the Liberal Opposition, held mass meetings and arranged demonstrations, and, when the bill came up for discussion, marched to the legislative hall and presented a monster petition. The President of the Chamber, Gen. Mano, promised that the petition would be considered; but when the Chamber proceeded to discuss the bill and the police cleared the hall, the people began to throw stones and assault the police and the ministers and Deputies when they appeared on the street. The mounted police dispersed the mob, and when the riot was

renewed on the following day it was suppressed by the regular troops.

RULE OF THE ROAD. A law has been defined to be "a rule of action prescribing what is right and prohibiting what is wrong." Under the law popularly known as the Rule of the Road are included the regulations concerning passage from place to place on land, and the rules regulating lights, signals, steering, and sailing on the water. The rule of the road is one of those laws to which we yield instinctive obedience constantly in daily life; and when we are walking through the streets, riding or driving on the highways, or traveling by railroad, steamboat, or sailing vessel, it is the rule of the road that protects us from injury to person and property.

For Pedestrians.—The rule of the road for foot passengers requires them to keep to the right of the footpath or highroad. This provision of the law follows a custom dating from time immemorial. Primitive man always turns to the right, for it is in the right hand that men carry their weapons or their burdens, and turning to the right obviates the danger of the two burdens colliding. So far as we know, the first actual enactment giving the force of law to this custom is several centuries old, dating from the time when Pope Boniface, to prevent accidents among the vast concourse of pilgrims flocking to Rome, gave orders that in crossing the bridges the people should keep to the right-hand footway, leaving the left side to persons going in the opposite direction. This differs little from our plan, which is to take either footway we please, but to keep to the right-hand moiety of it. And if, by reason of our keeping to the left, we come into collision with another person who is keeping to the right, we are responsible for any damage that results. The rule of the road is more frequently violated by women, either from their ignorance or from their desire to look into the shop windows. In every civilized country the rule of the road for pedestrians is the same, except that among the German nations officers of the military service have the right of way, and they may keep to the right or left as they choose, and others must give place to them.

For Equestrians and Vehicles.—But the carriage ways are more important than the footways in the matter of the rule of the road. The speed with which horsemen and vehicles move, and the serious results of any collision between them, must have created in the very earliest times some kind of system. In the United States the power to regulate all traffic or passage on land (unless it be interstate commerce) is inherent in the several States, and the General Government has no authority to prescribe laws on the subject. In all the States the rules of the road are identical: When we meet persons coming the opposite way we must turn to the right, and in passing any one whom we have overtaken we must pass to the left. Equestrians, vehicles, and foot passengers have equal rights to the road, and each must respect the rights of the others. Some of the States have special statutes on this subject; others have held the custom to be part of the common law.

While the generality of pedestrians in all countries keep to the right, there are some countries in which drivers and riders keep to the left.

Such is the case in England, and in parts of Italy and Switzerland. Couplets and quatrains in considerable number have been composed to impress the English rule on the memory of those persons who can call to mind a particular maxim with more readiness if it be set forth in rhyme. One of these is as follows:

The rule of the road is a paradox quite;
In riding or driving along,
If you keep to the left you are sure to go right,
If you keep to the right, to go wrong.

Much debate has arisen upon the respective advantages resulting from keeping to the right or turning to the left. Those who prefer the American method of keeping to the right urge that it is better to adopt the same rule for the carriage ways as for the footways, in order not to burden the memory with conflicting rules; they also contend that it is better because it gives more scope and sweep to the whip of the driver. The advocates of the English method can find no argument save that by turning to the left each driver can see at a glance whether the passing wheels have space to keep clear of each other.

The fact that the American rule of the road differs from the English rule has provoked much comment. It is argued that as we have inherited the crude framework of our Government and the mass of our common law from England, so we should have inherited the English rule of the road as part of those customs and laws. But the reason of the divergence is not difficult to determine. The earliest Anglo-Saxon emigrants to New England were for some time prior to their landing on Plymouth Rock domiciled in Holland, where the rule of the road was to keep to the right. Habituated by their stay in Holland to observe this custom, the pilgrims of the "Mayflower" very naturally followed it after arriving in America, and it became the approved method of avoiding collision. The custom must have received additional confirmation from the French Huguenots who sought an asylum here (and who, of course, followed the custom of France in this respect), and from the influence of the Dutch in New York.

For Vessels.—But the observance of the rule of the road is far more important at sea than on land, because the safety of life and property is so absolutely dependent upon it. On a dark night on a broad ocean ships are traveling in different directions, each carrying a light or lights as a beacon. This beacon would not suffice without the establishment of rules for passing, overtaking, and crossing.

The laws of all the commercial nations regulating traffic on the sea are very nearly identical, so that, though each ship obeys the regulations of its own government, yet if two vessels of foreign countries come into collision the same rules to determine the blame are enforced against each.

By the Constitution of the United States, Congress has the exclusive power to regulate the traffic on the high seas and inland navigable tide waters; yet some of the States have laws (often relics of preconstitutional times) regulating navigation on the waters within their boundaries; but in such instances the State laws are identical with laws of Congress and need not be specifically mentioned here. The laws passed

by Congress are divided under three heads—lights, signals, and sailing and steering—and declare that every steam vessel which is under sail, and not under steam, shall be considered a sailing vessel, and every steam vessel which is under steam, whether under sail or not, shall be considered as a steam vessel.

Lights.—In all weathers, between sunrise and sunset all steam vessels under way shall carry on the starboard side a green light of such character as to be visible on a dark night, with a clear atmosphere, at a distance of at least two miles, so constructed as to throw a uniform and unbroken light over an arc of the horizon of ten points of the compass, and so fixed as to throw the light from right ahead to two points abaft the beam on the starboard side. Similarly, a red lamp must be carried on the port side, and these lamps must be fitted with inboard screens, so as to prevent them from being seen across the bows. In addition to these side lights, all ocean-going steamers and steamers carrying sail shall show at the foremast head a bright white light visible for five miles. Steam vessels, when towing other vessels, shall carry two bright, white, masthead lights, one over the other. River steamers navigating waters flowing into the Gulf of Mexico must carry on the outward side of their smoke pipes red and green lights. All other steam vessels must carry the red and green lights and two white lights, one at the bow and the other at the stern, at least 15 feet above the bow light. The lights of ferryboats, however, are to be regulated by the supervising inspectors of steam vessels.

All vessels at anchor must show a white light in a globular lantern, at a height not exceeding 20 feet above the hull. Open boats are not required to carry the side lights, but if they do not they must have red and green lanterns to show when they approach other vessels.

Fog Signals.—Steam vessels under way must sound a steam whistle at intervals of not more than one minute; sailing vessels under way must sound a fog horn every five minutes; and all vessels not under way must sound a bell at intervals of not more than five minutes.

Steering and Sailing.—If two sailing vessels are approaching each other so as to involve the

risk of collision, each must pass to the port side of the other (see A). When two sailing vessels

are crossing so as to involve risk of collision, the vessel with the wind on the port side shall keep out of the way of the vessel with the wind on

the vessel that is to windward shall keep out of way of the vessel that is to leeward.

Two steam vessels meeting end on, so as to in-

the starboard side (see B), except when the vessel with the wind on the port side is close hauled

volve risk of collision, shall pass to the right (see A). When two steam vessels are crossing so as to involve risk of collision, the vessel that has the other on her own starboard side shall keep out of the way (see F). The steam vessel must

and the other vessel free, in which case the latter vessel must keep out of the way (see C).

But if they have the wind on the same side (see D), or if one of them has the wind aft (see E),

give way to the sailing vessel. Every steam vessel, when approaching another vessel so as to involve the risk of collision, must slacken her speed or stop and reverse; and in a fog every steam vessel must go at moderate speed.

Every vessel overtaking another vessel must keep out of the way of the overtaken vessel.

These rules are not to be followed blindly, for special circumstances may render a departure from them necessary.

RUSSIA, an empire in northern Europe and Asia. The legislative, executive, and judicial power is concentrated in the Emperor. The throne is transmitted through the male line by primogeniture, and to female descendants in default of males, in the Romanoff-Holstein-Gottorp family. The Emperor is assisted by the Committee of Ministers, members of which preside over the executive departments and suggest projects of law relating to them; the Council of State, which examines projects of law and discusses the budget; the Ruling Senate, which

superintends the judiciary, acts as the court of last resort, and examines into the general administration of the country; and the Holy Synod, which superintends religious and ecclesiastical affairs. The ministers in 1893 were as follow: President, N. C. Bunge; Minister of the Imperial Household, Count Vorontzoff-Dashkoff; Minister of Foreign Affairs, Nicolas Carlovich Giers; Minister of War, Gen. P. S. Vannovsky; Minister of Marine, Admiral N. M. Tchikhatcheff; Minister of the Interior, J. D. Durnovo; Minister of Finance, S. J. Vitte; Minister of Communications, Krivoshein; Minister of Public Instruction, Count J. D. Delianoff; Procurator-General of the Holy Synod, K. P. Pobiedonostseff; Minister of Agriculture and Domains, A. S. Yermoloff; Minister of Justice, N. A. Manassein; Controller-General, T. J. Filippoff; without portfolio, D. M. Solski and N. J. Stoinovsky; also the Grand Dukes Nicholas, Vladimir, Alexis, and Michael.

Finances.—The ordinary revenue for 1892 was 970,164,000 rubles, which was 83,620,000 rubles better than the budget estimate. The extraordinary receipts amounted to 198,679,000 rubles. The ordinary expenditures amounted to 910,684,000 rubles, or 984,000 rubles less than the estimate, and the extraordinary expenditures to 214,771,000 rubles. In the budget of receipts for 1893 the direct taxes are calculated at 94,950,680 rubles, of which 44,703,249 rubles are the product of land and personal taxes, 37,732,431 rubles of trading patents, and 12,515,000 rubles of a tax of 5 per cent. on incomes from capital; the yield of indirect taxes is 535,900,773 rubles, of which 134,970,000 rubles come from customs, 339,651,323 rubles from duties on consumption (257,393,721 from drinks, 30,043,102 from tobacco, 16,041,000 from petroleum, 28,655,500 from beet sugar, and 7,518,000 from matches), and 61,279,450 rubles from stamp and registration duties and taxes on transportation and travel by express trains, on passports, on fire insurance, etc.; 38,537,114 rubles come from state monopolies, 22,677,400 from posts (11,950,000 from telegraphs, and the remainder from mines and the mints); 136,322,617 rubles are derived from state property (81,189,000 from railroads, 13,647,282 from rent of domains, 10,780,769 from movable property, 827,720 from sales of land, 16,716,680 from forests, 9,489,076 from mines and manufacturing, and 3,672,100 from railroad concessions); 77,000,000 rubles are paid by peasants for the redemption of land; and 78,510,959 rubles are miscellaneous receipts. The total estimated revenue is 961,222,143 rubles from ordinary and 79,236,242 from extraordinary sources. The total ordinary expenditures are estimated for 1893 at 947,690,885, and the extraordinary expenditures at 92,768,000 rubles. Of the ordinary expenditures, 264,325,647 rubles are for the public debt (including 68,021,242 rubles for railroad loans), 2,115,165 rubles are for the superior government bodies, 11,887,004 rubles for the Holy Synod, 10,560,000 rubles for the Ministry of the Imperial Household, 5,289,909 rubles for the Ministry of Foreign Affairs, 232,937,030 rubles for the Ministry of War, 49,892,803 rubles for the Ministry of Marine, 122,572,579 rubles for the Ministry of Finance, 25,458,305 rubles for the Ministry of Domains, 82,352,

659 rubles for the Ministry of the Interior, 22,411,434 rubles for the Ministry of Public Instruction, 70,800,814 rubles for the Ministry of Communications, 25,310,830 rubles for the Ministry of Justice, 4,466,043 for the Department of Control, 1,310,163 rubles for the imperial stud, and 16,000,000 rubles for unforeseen uses.

The Government debts payable in specie on Jan. 1, 1893, amounted to 547,586,500 rubles, besides £2,489,700 sterling. The sum of the debts payable in credit rubles was 2,889,585,622 rubles, including 568,527,206 rubles of paper currency not secured by reserves. This does not include the debt of the Kingdom of Poland or the railroad obligations, which raise the total to 1,275,399,077 metallic rubles, 3,079,800,785 credit rubles, £2,489,700 sterling, and 541,502,000 francs. A new internal 4½-per-cent. loan of 100,000,000 rubles was sanctioned in March, 1893, to cover the deficit in the budget for that year and the disbursements of the treasury on account of the famine of 1891. The Government in the same month suspended the coinage of silver rubles on private account, the depreciation in silver having lowered their exchange value till they were worth less than the paper ruble, which is payable in silver or gold. The amount of paper currency which under the law ought to have been destroyed in 1892 was kept in the treasury to tide over the difficulty caused by the famine-relief expenditure. The Minister of Finance resorted to extraordinary measures to check speculation in paper rubles, refusing to allow the Imperial Bank to pay out any except for the purposes of legitimate trade. He asked for the co-operation of bankers in devising regulations to prevent speculation. A law was passed imposing a tax of 1 kopeck per 100 rubles on currency sent or carried out of the country. Importation of foreign silver coins forbidden.

Commerce and Production.—The total value of the imports of merchandise for 1892 was 403,900,000 rubles, of which 346,600,000 rubles came from Europe, 11,900,000 rubles from Finland, and 45,500,000 rubles from Asia. The total value of the exports was 489,400,000 rubles, of which 399,600,000 rubles went to Europe, 21,100,000 rubles to Finland, and 68,700,000 rubles to Asia. The values of some of the chief imports by the European frontiers were: Raw textiles and yarn, 114,078,000 rubles; metal goods and machinery, 36,636,000 rubles; raw metals, 26,458,000 rubles; tea and coffee, 20,038,000 rubles; coloring matters, etc., 12,908,000 rubles; coal, 12,122,000 rubles; skins, leather, and peltry, 8,382,000 rubles; wines and spirits, 8,282,000 rubles; textile manufactures, 6,388,000 rubles. The principal exports by the way of the European frontiers were: Cereals, 136,025,000 rubles; textile materials, 81,798,000 rubles; timber, 48,652,000 rubles; linseed, 27,077,000 rubles; animals, 15,178,000 rubles; skins and peltry, 11,693,000 rubles; sugar, 5,772,000 rubles; textile manufactures, 5,398,000 rubles. The principal import from Asia was tea of the value of 18,783,000 rubles, and the principal exports to Asia were cereals, tissues, and miscellaneous merchandise. The imports of precious metals were 110,531,000 rubles from Europe and 3,015,000 rubles from Asia, and the exports were 117,000 rubles to Europe and 4,316,000 rubles to Asia. The Gov-

ernment has lately decided to appoint official commercial agents in central Asia and also in the European and American centers of trade. Bokhara and the Russian part of the Pamirs have been incorporated in the Russian customs frontiers.

Navigation.—There were 5,650 vessels entered at the Baltic ports, 642 at the White Sea ports, and 4,514 at the Black Sea and Sea of Azov ports in 1891; total, 10,806 vessels, of which 4,790 carried cargoes and 6,016 were in ballast. The departures numbered 5,512 from Baltic ports, 615 from White Sea ports, and 4,518 from the Southern ports; total, 10,640, of which 9,523 carried cargoes and 1,117 were in ballast. The total number of steamers entered was 7,711, and cleared 7,618. Of the total number of vessels entered, 8,359 were English, 1,529 German, 1,387 Russian, 1,349 Swedish and Norwegian, 1,017 Danish, 686 Turkish, 213 Austrian, and 182 Dutch, etc.

Communications.—The railroads have a total length of 27,814 versts, or 18,340 miles, without counting the railroads of Finland or the Transcasian line of 900 miles. The eastern section of the Trans-Siberian Railroad, from Vladivostok to Nicolsk, was opened in the beginning of September, 1893. The Cesarevich has been made president of the committee for expediting this national undertaking. The state and other telegraphs have a length of 126,474 kilometres, with 801,240 kilometres of wire. The number of dispatches in 1891 was 12,133,940. The post-office carried 192,005,000 domestic and 25,679,000 foreign letters, 30,345,000 postal cards, and 169,833,000 printed inclosures.

The Army.—The army is organized in 21 corps of about 45,000 men each, distributed in 14 circumscriptions. The infantry, which is armed with a repeating rifle very much like the French Lebel, comprises 165 regiments of the line, 20 regiments of chasseurs, 16 regiments of grenadiers, and 12 regiments of the guard. The cavalry is divided into 671 squadrons, of which 352 are regular cavalry, including cuirassiers, dragoons, hussars, and uhlands, and 319 are Cossacks, who furnish their own horses and uniforms, and are therefore exempt from all taxes. The artillery is composed of 96 siege batteries, 194 field batteries, 15 mountain batteries, 43 mounted batteries, and 3 mortar regiments, having altogether nearly 5,000 field and light guns and 1,500 siege guns.

About 1,000,000 young men are available annually for service, of whom the best are enrolled in the active army and the rest in the militia. The militia, which is composed of all able-bodied Russians between twenty and forty-five years of age who are not in the active army, is divided into two vans. The first van, destined to fill vacancies in the regular army and its reserve, is made up of the young men and those who have served their time in the regular army and reserves. The second van constitutes a territorial militia, to which recourse would be had only in case of invasion or extraordinary danger. The peace strength of the active army is 50,561 officers and 787,372 rank and file; total, 817,933. The war strength is 3,420,746, without counting the Cossacks or the territorial army. The first steps were taken in 1893 to Russify the Finnish

army, which under the privileges granted by the Emperors after the conquest has had a national organization entirely distinct from the Russian military system, being commanded exclusively by Finnish officers and liable to service only for the defense of Finland. When encamped for the first time with the Russian troops, in the summer of 1893, the Finnish soldiers showed their animosity in various acts of violence. The Russophiles, who dominate the Government, wish to see the Finnish troops added to the effective force of the empire and commanded where necessary by Russians and to change the period of active service in Finland from three years to five, so as to put the Finns on the same footing as Russians, and abolish the Finnish militia.

The Navy.—The Russian navy is composed of four separate fleets—on the Black Sea, the Baltic, in Siberia, and on the Caspian. The Baltic fleet in 1893 consisted of 5 armored turret ships, 16 armored cruisers, 1 casemated cruiser, 12 armored coast-guard monitors, 3 armored gunboats, 2 flush-decked cruisers, 11 clippers, 3 torpedo cruisers, 3 corvettes used as school ships, 10 torpedo gunboats, 6 yachts, 3 floating batteries, 13 first-class torpedo boats, 80 small torpedo boats, and 6 transports, carrying altogether 379 large and 894 small guns. The Black Sea fleet comprised 5 armored turret ships, 2 *popoffkas*, 1 cruiser, 8 gunboats, 3 steamers, 2 torpedo cruisers, 16 first-class torpedo boats, and 6 transports, having an aggregate armament of 88 large and 295 small guns. In Siberia there were 4 gunboats and 2 torpedo boats, and on the Caspian 2 gunboats and 4 other vessels. The navy was manned by 1,249 officers, 807 employees, and 25,736 seamen. In the beginning of October, 1893, the "Roosika," one of the old ironclad monitors, went down in the Gulf of Finland with all on board. A new naval and military port was opened in August, 1893, at Libau, which will also be opened for commercial vessels. This port is not as liable to be closed by ice as Cronstadt. A naval commission has been appointed to select a naval harbor on the northern coast near the Norway frontier, whence war ships could have access to the ocean in case the Baltic fleet should be blockaded by Great Britain or some other naval power. The site chosen is the Bay of Pujmanki, near Cape Kalassari, in northern Finland, which can be connected with the northern terminus of the Finland railroad system at Uleaborg by 400 miles of railroad. A squadron was stationed in the Mediterranean in 1893, consisting of some of the vessels that visited America, and afterward returned at Toulon the visit of the French fleet at Toulon. The "Rurik," a large cruiser, carrying 4 8-inch and 16 6-inch guns, one of the fastest vessels afloat, was equipped in 1893, and the "Ushakoff," a powerful ironclad for coast defense, was launched in the Baltic yard on the Neva, and at Nikolaieff the "Three Saints," the sixth first-class battle ship in the Black Sea.

Tariff War with Germany.—In November, 1891, negotiations were begun for a commercial treaty with Germany, to facilitate which the Russian Government lowered its duties on a large number of articles. The German Government, anxious to secure favorable tariff arrangements with Austria, Italy, Belgium, and Switzer-

land, and, influenced by the demand for protection, preferred to carry on a tariff war with Russia, which was then willing to bind itself not to raise its tariff for a certain time on a list of articles manufactured in Germany, asking in return reductions in the German duties on cereals, wood, cattle, etc. After the German treaties were made with the countries of the triple alliance, Russian corn had to pay 42 per cent., wood 33 per cent., horses 100 per cent., and eggs 50 per cent. higher rates than similar imports into Germany from other countries. The Russian Government tardily resorted to retaliatory measures, framing a new general tariff and applying it to Germany, while to France and other European countries and the United States were given the advantage of special rates; and, lastly, differentiating against the considerable German trade with Finland subsequent to the new German treaty with Roumania, admitting Roumanian rye on reciprocity terms. Germany is the only export market for Russian rye, and the closing of this market caused great distress among the farmers, which the Government endeavored to alleviate by purchasing supplies for the army sufficient to last for years and by constraining the banks to lend money on the stock of unsold grain to the amount of 50 per cent. of its market value. The German consumers were not put to as great inconvenience as the Russian farming population which has formerly supplied them, because imports from Roumania, America, and perhaps some from other parts of Russia imported through Roumania or Austria, kept down the price. In the beginning of October the negotiations for a treaty were resumed in Berlin, and in two months one was concluded at last in

which Germany made satisfactory concessions. While the German agrarian party continued to oppose it bitterly, it was no less obnoxious to the Russian manufacturing interests, which are concentrated at Moscow. In the arrangement, as negotiated by the plenipotentiaries, Russia makes a reduction in the duties on textiles, paper, leather, woodwork, ceramic wares, musical instruments, chemicals, minerals, iron, tin, and copper wares, agricultural instruments, starch, and vegetables averaging 20 per cent., and reduces the rates on coal and on telegraph materials 50 per cent. The German duty on Russian cereals is lowered 30 per cent.

Bering Sea Sealing.—In July, 1892, the naval authorities patrolling the waters adjacent to the Russian seal rookeries in Bering Sea captured 6 Canadian schooners, on which were found guns for killing seals in the water and clubs for killing them on land and a large number of seals, of which 90 per cent. were females. The British Government protested, but agreed to a provisional arrangement regulating sealing for 1892. Russia claimed a territorial limit of 30 marine miles from the coasts of Robben and the Commander Islands and 10 miles from the Kamchatka coast, to which the British Government agreed, while the Russian Government agreed to restrict the catch on the islands of Komandorsky and Tulenew to 30,000 seals for the year. British naval vessels were to co-operate in enforcing the regulations. The British Parliament ratified the agreement in June. In July the Emperor issued an ukase forbidding the killing or capturing of fur seals, in any waters under the control of Russia, without especial permission from the Government.

S

SALVADOR, a republic in Central America. The legislative body is a single Chamber of 42 Deputies, elected annually by the votes of all citizens except public functionaries. The President is elected for four years by universal suffrage. The active troops number 4,000 and the militia 15,000. Gen. Carlos Ezeta was elected for the term beginning March 1, 1891.

The area of the republic is 8,100 square miles. The population was 780,426 in 1892.

The receipts of the treasury for 1892 were \$6,896,000, including a loan of \$1,702,000. The import duties amounted to \$3,045,000; tax on brandy, \$1,650,000; stamps and post-office and telegraph receipts, \$490,000. The expenditure for war was \$1,676,000; for the interior, \$1,086,000; for financial administration, \$396,000; for justice, \$195,000; for public instruction \$308,000; for public works, \$323,000; for amortization of loans, \$2,732,000; total expenditures, \$6,784,000. The internal debt in 1892 amounted to \$3,614,000, and the foreign debt to £269,519.

The value of the imports in 1892 was \$2,756,000; of the exports, \$6,838,000. The exports of coffee were worth \$4,500,000; of indigo, \$1,151,000; of sugar, \$164,000; of tobacco, \$158,000.

There are 62 miles of railroad. The telegraphs have 2,396 miles of wire. The number of

dispatches in 1892 was 602,047, of which 198,796 were official. The post-office in 1891 forwarded 609,658 pieces in the internal and 1,058,212 in the foreign service.

SAMOA, a monarchy occupying the Samoan Islands in the Pacific Ocean, declared independent and neutral by the Samoan Conference at Berlin, June 14, 1889. King Malietoa Laoupepa, who succeeded to the throne in 1880, was deposed by the Germans and carried away as a prisoner, first to the Cameroons and afterward to the Marshall Islands. In consequence of the protests of the United States, supported by Great Britain, the German protectorate was not consummated, King Tamasese was dispossessed, and the exiled King was restored on Dec. 10, 1889. In the treaty the three powers agreed to allow the native people to govern themselves according to their own laws and customs and elect their sovereign. It was stipulated, however, that Malietoa Laoupepa should be restored, and his successor elected according to native custom. A European chief justice was appointed to decide cases affecting the interests of foreigners. All future sales of land to foreigners was prohibited. O. K. W. von Cedercrantz, a Swedish jurist, was appointed Chief Justice.

The area of the islands is 1,700 miles and the population 36,000. There are about 300 whites,

over two thirds of them British subjects and Americans, and the others mostly German, and 1,000 Polynesians from other islands laboring on the plantations. The imposts raised from foreigners amounted in 1892 to 114,563 German marks, of which the Germans paid over 62 per cent., the English 20 per cent., Americans 10 per cent., and other foreigners 8 per cent. Of the total imports, valued at 1,303,702 marks, German houses imported 51 per cent., English, 22 per cent.; American, 15 per cent.; and others 12 per cent. Of the exports, consisting, besides copra, of cotton, coffee, and fruit, and valued at 768,583 marks, German houses exported 62 per cent. and English houses 38 per cent.

After the restoration of Malietoa, as when Tamasese was King, the foreigners domineered over the natives and took advantage of them in money transactions. The chiefs and people, who are of the same race as the Hawaiians, became involved hopelessly in debt, and the native Government, under the guidance of the two European officials, the Chief Justice and Baron Senft von Pilsach, the German President of the Municipal Council in Apia, who is the official adviser of the King, was reduced almost to bankruptcy. Malietoa, when he was first placed back on the throne, abdicated in favor of Mataafa, but he was induced to resume the royal authority by the white officials, the Berlin Conference having decided that he should be restored. Mataafa again became the leader of a patriotic party opposed to foreign domination, and he was encouraged by some of the whites, who hoped to profit by war and revolution. Mataafa, the hero of the war with the Germans, was the choice of the people, who had elected him according to their laws, but were overruled by the powers; hence they refused to pay the capitation tax of \$1 for each man, woman, and child, which was the only source of revenue for the King's Government, the customs duties and other taxes levied on the whites having been held to be reserved for the expenses of the town and port of Apia. The treaty provided for the taxation of real property in Apia, but the municipal council would not pass the necessary ordinance, although it levied the tax on workmen and others whose property lay outside of the town limits. The municipality was supported by the customs duties until the Chief Justice decided that they belonged to the General Government. This bankrupted the municipality, until the decision was overruled by the three powers on complaint of the consuls, when the King's Government was again left without money to pay salaries and other obligations. There was constant friction between the Chief Justice and the King's adviser, who endeavored to carry out the spirit of the treaty by safeguarding the interests of the people, and the white planters and traders, on the other hand, and their champions, the foreign consuls. The treaty had imposed a curb on the German Trading and Plantation Company, which formerly dominated the Government and had a free hand to acquire all the fertile land of the islands and cultivate it with imported contract laborers, but in giving a better chance to the British and Americans it exposed the natives to the avaricious wiles of many ingenious individuals instead of the more open

rapacity of a single great corporation. The people, while never questioning the patriotism and good intentions of Malietoa, regarded him as the creature of the whites, and except the Tuamasa, who live in the province surrounding Apia, none would obey his rule, and all looked to Mataafa to deliver them from the foreigners and regain their independence. With the white officials at loggerheads with the white people and the native authorities repudiated by the natives, the purposes of the tripartite treaty were frustrated, and the political, social, commercial, and productive conditions of the country lapsed into chaos. The only real ruler was Mataafa, who set up a camp and a court at Malie, not far from Apia, hoping to impress upon Malietoa and the whites the necessity of carrying out the final act of the Berlin Conference by re-establishing an untrammelled native Government for native affairs. He actually collected some of the head tax and sent it to Malietoa, with whom his relations were at first friendly, then grew strained and hostile as the country sank more and more into destitution and disorder. No one would pay taxes. The whites not only evaded the ground tax provided for in the final act, but found ways to escape paying customs duties. The natives gave a reason, satisfactory to themselves, for withholding the head tax, which was wanted for no public purpose, but only to enable the judge and the president to draw their salaries of \$6,000 and \$5,000 respectively and ship the gold off to Europe. These well-meaning but inexperienced and incompetent officials had no friends either among the whites or the blacks. Their mistakes were magnified and their motives distorted in the only newspaper, and this led the president to commit the serious blunder of secretly buying the newspaper with some of the public funds that remained in the treasury, the proceeds of customs duties that had at first been more effectively collected and had accumulated until they were assigned by the judge's contradictory decrees, first to the municipality, and then to the royal Government. This and the building of an official residence for the president and the payment of salaries left the treasury empty, and thus the ordinances for the building of bridges and improvement of roads could not be carried out. A curious example of the crude misconceptions of the young German was his edict declaring that the pound sterling and the 20-mark gold piece were to be received at \$5 in United States money, which is the currency of the country, instead of \$4.76, the exchange value. Baron von Pilsach and Judge Cedercrantz both wanted to resign early in 1893 when they saw that their attempt at government was a hopeless failure. The powers had to deliberate and confer before appointing new men. Meanwhile the natives were drifting into a situation that must result in civil war. Mataafa's followers said that if war came they would drive the whites from the islands; Malietoa's followers said that this would serve them right, for they were the cause of all the trouble; the whites said that the only solution was to annex the islands to some European power and make them rulers over the natives. Mataafa's people had a few firearms that had been hidden away after the last war or smuggled

in. Malietoa had more and better rifles, and he determined to break up the rival Government at Malie. First he asked the powers to intervene, and they tardily sent war ships to Samoa, but none would act until the naval forces of all three were present. After the long preliminary deliberations and challenges that precede Samoan warfare, and after the naval vessels of all the treaty powers had arrived, Malietoa encamped with his Tuamasaga warriors near Malie. Skirmishing began on July 7. An indecisive battle was fought on July 13, in which 30 of Mataafa's men were killed and 20 wounded. The Tuamasaga, boasting a victory, marched into Apia displaying in triumph the heads of their fallen enemies. Before hostilities could proceed further the war ships intervened and sent a force against Mataafa, to which he surrendered. A conference of the consuls and naval commanders decided that he should be deported, with 10 of his chiefs, to the Marshall Islands, while 24 other rebels were sentenced to penal servitude for three years and 87 were fined. Mataafa was carried away into exile, and the native party for a time dispersed and deprived of a leader. The unpopular judge and president of the municipal council were at length relieved. Henry Ide, of Vermont, was, in September, appointed Chief Justice, and Baron von Pilsach was replaced by a German named Schmidt, who had been a vice-consul on the islands.

SANTO DOMINGO, a republic in the West Indies occupying the eastern part of the island of Hayti or Santo Domingo. The Congress is a single House of 22 members, elected indirectly for four years, like the President and Vice-President. The President is Gen. Ulises Heureaux, who was re-elected in November, 1892. The revenue was about \$2,000,000 in 1893.

The area of the republic is 18,045 square miles. There are about 417,000 inhabitants, of mixed negro, Indian, and Spanish blood, speaking the Spanish language, and in the towns also French or English. The imports in 1892 amounted to \$2,480,000, and the exports to \$2,197,000.

There are 71 miles of railroad and 290 miles of telegraph. The post-office carried 204,546 internal letters, circulars, and papers, and 182,015 in the foreign service in 1889.

Attempted Revolution.—President Heureaux, who is a despot of iron will, has furthered the development of the natural wealth of the country. He encourages the introduction of American capital and enterprise, and favors the cession of Samana Bay to the United States Government. His enemies say that he is working for the annexation of Santo Domingo to the United States. A treaty has been made between Hayti and Santo Domingo whereby they mutually bind themselves never to grant any territorial rights over any part of the island to a foreign power. Notwithstanding this public compact, when an American syndicate treated in 1893 for the transfer to them of the Holland loan of \$7,000,000, guaranteed on the customs, together with the privilege of building a railroad from Palarto de Plata to Santiago, the opponents of the President circulated the story that for an enormous bribe he was giving Americans control over the revenues of the country, and preparing the way for annexation. This sus-

picion was enough to rouse an insurrection in Santo Domingo and secure sympathy and aid from Hayti. Risings occurred in the border districts and where the supporters of Marchena, the rival candidate for President in 1892, were strong. Heureaux, always swift and unhesitating in action, arrested Marchena after having granted him permission to reside in Paris, and confined him in the ancient Columbus tower. Other prominent men in the capital who were suspected of being implicated in the plot to overthrow Heureaux were arrested before the signal for revolution was given. The sporadic disturbances that occurred later were speedily and effectually stopped by energetic military measures that Gen. Heureaux carried out in person. Strong bodies of troops occupied the discontented districts. A boat's crew from the American schooner "Hatty Crosby" was fired on by the ignorant guards at Azua, although the boat displayed the United States flag. For this an apology was made and an indemnity promised to a seaman who was wounded. On Dec. 10, 1893, Gen. Campos, governor of the Azua district, was assassinated and a few days later an attempt was made to murder President Heureaux and his escort with dynamite bombs. Gen. Marchena and Carlos and Pablo Baez, nephews of ex-President Baez, were taken to Azua on a Government yacht, and on Dec. 21 were shot with the 6 dynamiters.

SERVIA, a monarchy in southeastern Europe. At the abdication of King Milan Obrenovich, March 6, 1889, in favor of his son, Alexander I, the executive powers were committed to a regency composed of J. Ristich, J. Belimarkovich, and K. S. Protich. The death of Gen. Protich in June, 1892, left only 2 Regents. Under the Constitution of Jan. 3, 1889, the Skupshtina, which meets annually to make laws for the nation, is composed of 134 members, 1 to 4,500 inhabitants, elected by the direct suffrage of all citizens who pay their poll tax. The Cabinet at the beginning of 1893 was composed of the following members: Premier and Minister of Foreign Affairs, J. Avankumovich; Minister of War, Gen. A. Bogichevich; Minister of Finance, D. Stoianovich; Minister of Public Works, K. Alkovich; Minister of Public Instruction, J. Giorgievich; Minister of the Interior, S. Ribaratz; Minister of Justice, Z. Belichkovich; Minister of Agriculture and Commerce, S. Gwozdich.

Area and Population.—The area of the kingdom is 19,050 square miles. The population was estimated at the end of 1892 at 2,226,741 persons, of whom 1,143,661 were males and 1,083,080 females. There are 143,684 individuals whose language is the Roumanian, and 37,581 speaking Bohemian. The number of marriages in 1892 was 20,934; of births, 93,883; of deaths, 74,128. Belgrade, the capital, has 54,249 inhabitants.

Finances.—The budget for 1893 makes the total revenue 60,135,839 dinars or francs, of which 22,186,469 dinars are derived from direct taxation, 3,700,000 dinars from customs, 3,000,000 dinars from excise, 12,426,000 dinars from the tobacco and salt monopolies, 2,395,000 dinars from law courts, 9,230,000 dinars from state property, including railroads, posts, telegraphs, mines, manufactories, and domains, and 7,198,370 dinars from other sources. The total expendi-

tures are set down as 62,719,846 dinars, including a supplementary credit of 2,609,251 dinars. The chief items are 20,466,188 dinars for the public debt, and 11,327,483 dinars for the army. The debt on Jan. 1, 1893, amounted to the capital sum of 324,956,542 dinars, of which 155,310,000 dinars were borrowed to build railroads.

Commerce.—The value of the imports in 1892 was 37,069,000 dinars, against 42,806,000 dinars in 1891; of the exports, 46,452,000 dinars against 52,480,000 dinars. The principal exports are prunes, wine, hogs, cattle, sheep, grain, and barrel staves. Every peasant owns his small farm, orchard, or vineyard.

Communications.—The state railroads have a length of 337 miles. The post-office hauled 5,195,000 internal and 3,655,000 foreign letters in 1891, besides 354,000 postal cards. The telegraphs have a total length of 1,942 miles, with 3,717 miles of wire. The number of dispatches in 1892 was 653,449, of which 463,798 were paid domestic dispatches.

The Army.—The law of Jan. 31, 1890, introduced obligatory service for one year with the colors. The strength of the active army and its reserve is 2,474 officers and 102,233 men with 26,486 horses and 282 guns. The military strength of the nation, including the first and second bans of the militia, is 57,000 officers and 239,950 men, with 45,100 horses and 402 cannon.

Politics.—After the dissolution of the Skupsh-tina in December, 1892, the Regents ordered the general elections to be held in February, 1893. The last Skupsh-tina was strongly Radical, but in spite of that fact a Liberal ministry had been appointed, and the Regents declared that even should the new Skupsh-tina contain a majority of Radicals, the latter would not be allowed to form a Government. The law prohibiting citizens to vote who had not paid their taxes was enforced against Radicals, while all Liberal votes were counted. When, nevertheless, the Radicals elected a majority, the Government declared the election of 7 Radical members illegal, and thereby obtained a majority of 3. Of the 134 members, the Liberals claimed 63, the Radicals 57, and the Progressists 3. The new Skupsh-tina was convoked on April 6, 1893. On the first day of the session the Radicals and Progressists left the House in a body and declared their intentions of remaining absent, thereby preventing the organization of the Chamber. The Regents simply declared the law passed in 1891 by a Radical majority increasing the number of delegates from 125 to 134 to be unconstitutional, organized the House, and commenced business.

The Coup d'État.—The abuse of power by the Regents had roused public indignation to the highest pitch, and fears were entertained of a civil war, when, on the night of April 13, 1893, King Alexander, still an infant, and during whose infancy the regency had been appointed, declared himself of age and took the reins of the Government into his own hands. For the purpose of carrying out this *coup d'état* he invited the Regents and all the ministers to a banquet, given in his palace, to celebrate his successful examinations as a Servian student. During the banquet the houses of the Regents and ministers were taken possession of by military forces, whose co-operation had been secured previously,

and all Government buildings were guarded by troops. After the third course of the banquet the King arose and addressed the Regents:

Gentlemen, for four years you, in my name, have administered the kingly power. I thank you heartily for the trouble you have taken. I now feel able to administer the power myself, and will exercise it from this moment. I beg you, therefore, at once to hand me your resignations in writing.

M. Ristich, the first Regent, replied that he could not and would not comply with the King's request, which, he said, was unconstitutional. The Regents and ministers remaining obdurate, they were then escorted to a wing of the palace and kept there under guard for the night, and their homes were guarded by soldiers for a few days longer. On April 14 the King issued a proclamation stating that the Constitution had of late been placed in sore jeopardy, the rights of citizens imperiled, and the constitutional position of Parliament so abased that no course was left open for the King but to make an end of this unhappy condition of affairs, and announcing that he took the kingly power into his own hands and that from that day the Constitution went into effective force and acquired its full significance. It further declared that the Regents, Ristich and Gen. Belimarkovich, were relieved of their posts, that the Cabinet of Avakumovich was dismissed, and that the newly appointed ministry was composed of the following members: Premier and Minister of Public Instruction, Dr. Dokich; Minister of Finance, Dr. Vuich; Minister of the Interior, M. Milosavlje-vich; Minister of War, Col. Franassovich; Minister of Foreign Affairs, Andreas Nikolich; Minister of Public Works, Lieut.-Col. Stankovich; Minister of Commerce, Milosheovich. The Skupsh-tina was immediately dissolved, and writs for new elections to be held on April 30 were issued. The change of government was received with rejoicing by the people. The elections resulted in the return of 121 Radicals, 11 Progressists, and 1 Liberal. The Liberals generally abstained from voting, but this reduced the total ballot only from 237,900 to 231,000. The ministers tendered their resignations when the Skupsh-tina met on June 13. All were asked to retain their posts except Gen. Franassovich, who made way for Gen. Sava Gruich, a Moderate Radical. The speech from the throne was a severe arraignment of the late Liberal Government, which, while the Regency was incomplete and therefore legally incompetent, to administer the country, had dissolved the Assembly, which was invested with the mission of filling the vacancy, and had unscrupulously endeavored to stifle the electoral voice of the country, and when the electorate refused to be intimidated, had altered its verdict, and finally, with the Regency not yet completed after the prescribed term had passed, opened an Assembly that was not legally constituted. The Radicals were in a difficult position in regard to the finances, because their party had demanded the repeal of the tobacco and salt monopolies, and many peasants were already illegally planting tobacco. The Liberals were in a large measure responsible for the deficits because they had been lenient in assessing and lax in collecting taxes in order to attract the peasantry to their

party. The Radical Minister of Finance was compelled to put an end to these illegal practices and not only retain the tobacco monopoly, but impose duties as heavy as those on tobacco and salt on spirits, petroleum, cigarette paper, and matches, and also to issue a loan of 44,000,000 francs. New commercial treaties with Austria-Hungary and Germany and with Great Britain reduced the income from import duties. The new loan was required to pay off the floating debt and for strengthening the military establishment, an object not favored by the Radicals, who have formerly demanded the abolition of the regular army. The Extreme Radicals, though not admitted in the Cabinet, were predominant in the Skupstina. They gave their chief attention to drawing up articles of impeachment against the ex-ministers, overriding in this the wishes of the Government. Among the instances in which they were charged with invading personal and property rights were the suppression of a communal council and the incarceration of all the members, and the shooting down of 16 peasants in Gorachitza by regular soldiers. The new Government took steps to settle a troublesome boundary question that has been pending since 1884 by appointing commissioners to meet Austrian commissioners and delimit the frontier between Serbia and Bosnia near the river Drina.

SIAM, an absolute monarchy in southeastern Asia. Khulalongkorn, born Sept. 20, 1853, the fifth sovereign of the dynasty founded by Chakri in 1782, succeeded his father, Maha Mongkut, in 1868. The area is about 250,000 square miles, including the Laos territory now annexed to French Indo-China, and the estimated population 6,000,000, of whom 2,000,000 are Siamese, 2,000,000 Laotians, 1,000,000 Malays, and 1,000,000 Chinese. Bangkok, the capital, has 350,000 inhabitants, of whom half are Chinese. The King's revenue is about \$10,000,000, obtained from invested funds, monopolies of spirits and opium, customs, royalties of tin mines and fisheries, a tax on gambling, etc. The standing army numbers 12,000 men, but all able-bodied men may be called into the service. The Government had 60,000 stands of improved arms, and procured more during the dispute with France in 1893. The naval force consists of 1 protected cruiser, 2 wooden corvettes, 6 gunboats, and 3 yachts. The navy is officered by Danes and Englishmen, and the King's guard of 4,000 men, armed with Mannlicher rifles and Krupp field guns, has been instructed by German officers.

The imports in 1892 were valued at \$9,425,000. The value of the exports was \$10,084,000, consisting principally of the following articles: Rice, \$6,897,000; teak wood, \$457,000; pepper, \$389,000; dried and salted fish, \$353,000; cattle, \$199,000. The external trade is mainly in the hands of the English, the Germans coming next and the French third. Formerly the French share was much larger than it is now. The main part of the commerce is with Singapore and Hong-Kong, carried in English bottoms. The internal commerce is in the hands of the Chinese. There is a postal service directed by Germans which forwarded 208,872 domestic and 234,537 foreign letters in 1891. Bangkok has electric lighting and various other modern im-

provements, including an electric street railroad built by Americans. A steam railroad between Bangkok and Paknam was opened for traffic on April 11, 1893.

Conflict with France.—The Mekong river, north of Cambodia, runs through the country of the Laos tribes. They are of the same race as the Siamese, and those bordering on Siam have long paid tribute to the court at Bangkok, while those dwelling between the river and the mountains that divide them from Annam were formerly unwilling vassals of the Emperor of Annam. During the hostilities that ended with the establishment of a French protectorate over Annam the Annamite garrisons were withdrawn from the positions which they held in the Laos States, whereupon the Siamese established posts on the upper river and in the north checked the ravages of the Chinese marauders. North of the Laos States, on both sides of the Mekong, are Shan tribes over whom the British Indian Government claimed some suzerain rights as the successor to the empire of the Kings of Burmah, which were disputed in respect to the provinces between the eighteenth and twenty-first parallels by Siam and in respect to the country north of the twenty-first degree of latitude by China, and which it abandoned to those powers in return for compensation in other quarters. M. Ribot, in 1892, first asserted the historical claim of Annam to the whole left bank of the upper Mekong and of Cambodia to the valuable district east of the river in the vicinity of the cataracts which was actually occupied and administered by Siam. After his announcement the Siamese Government took steps to render more effective their occupation of the disputed territory, while the French did nothing to give effect to their claims until the beginning of 1893, when they transported gunboats in sections to the river north of the cataracts and sent Annamite troops under the command of French officers over the mountains. The Laotians resisted the advance of their old enemies, and the Siamese Government raised a large army by conscription, stripping the rice fields of laborers in order to defend the eastern frontier. In the southeast of Siam the rich districts of Battambang and Angkor belong historically and ethnologically to Cambodia by a better title than any part of the Laos country does to Annam, for they are conquered provinces of the ancient kingdom whose inhabitants bear uneasily the yoke of the Siamese and desire to be reunited with their brothers. But the French Government was precluded from claiming these provinces by the treaty of 1856, which acknowledged them to be a part of Siam. Between Annam and Siam the boundary had never been delimited, and grounds for the French claim for a rectification of the frontier were furnished by the Laotian tribes, of whose incursions into Annam the French minister at Bangkok began to complain in 1889. The English railroad enterprises in Siam, one of which contemplated a line to Luang Prabang, the chief mart on the upper Mekong, near the border of the Shan States, caused the French to take active measures to adjust the frontier according to their idea. The arrangement to delimit the frontier between Siam and the northern Shan States by

a British Indian commission evoked a declaration in the Chamber from the French Government, which had not been consulted regarding the partition of the territory on both sides of the Mekong between Siam and China.

A border fight between some Laotians and the Annamite frontier guards afforded the desired pretext for the French advance. On April 1, 1893, a body of Annamite *tirailleurs* took the Siamese post of Stung Treng by surprise, and the Siamese commissioner and troops withdrew without fighting. Prior to the advance of the French forces the Siamese Government offered to submit the boundary question to arbitration, and suggested the President of the United States as an arbitrator. The Siamese commissioner to the Columbian Exposition had authority to ask the good offices of the United States, but was told by Secretary Gresham that the United States could not intervene. The British Government was appealed to for moral or material support, and the Siamese were left in doubt as to what assistance they could expect from that quarter until, after an exchange of views, the French Government, on giving assurance that the integrity and independence of Siam would be respected, was told that England would in no way oppose it in the conflict with Siam regarding frontiers. The Siamese Government made a proposition, when the French began their advance, that, pending a definite settlement of the frontier by arbitration or negotiation, a belt of country 30 miles wide, from the thirteenth to the nineteenth degrees of north latitude, should be marked off on the western side of the crest of the mountains, and that, with certain specified exceptions, all Siamese and Annamese garrisons should be removed from the whole of this belt and no new military posts established there, but that the civil administration should be in Siamese hands. When the French Government formulated its claim to the whole country down to the Mekong, the Siamese authorities refused to discuss it and made preparations to defend the Mekong valley with the assistance of the inhabitants, at the same time strengthening the fortifications of the Menam river below Bangkok. The older statesmen and the people in general were in favor of peace and compromise, but the foreign minister, Prince Devawongse, and the young nobility of the Queen's party were eager for war. Stung Treng had been occupied by a French force about nine years before, and after they evacuated it by a Siamese commissioner, who ruled by military force, but was unable to extend the conquest eastward of the river into Laos. Other points on the left bank of the Mekong north of Stung Treng were occupied by the Siamese later. After the French had regained possession of this village they next occupied, on April 4, the island of Kong or Khone, where there were 2 Laotian villages, and on it they erected fortifications, intending to launch there the gunboat flotilla for the middle Mekong. The Siamese garrison evacuated the island without resistance, and in like manner they gave up So Sang, Muong Vinh, and other posts. After they had begun their works at Kong a French column was suddenly attacked by an overwhelming force of Siamese and Laotians. Many Annamite soldiers were

killed, and Capt. Thoreux, the military commander, was taken prisoner. The Siamese authorities at Bangkok disavowed responsibility for the incident, attributing it to the inveterate hostility of the Laos tribes toward the Annamites. The Siamese mandarins led the Laotians against Kong, which they attacked several times and invested, cutting off supplies, until a French relieving column, under Capt. Adam de Villers, arrived on May 22. The important post of Cammon was surrendered to Resident Luce, and the mandarin was conducted to the Mekong by a French inspector of militia, M. Groscurin, and an Annamite escort. The Frenchman fell ill at Keng Chek, and the mandarin sent across the river for an armed force of Siamese, who on June 3 massacred the entire escort. M. Groscurin was shot, according to French report, while helpless in bed, by the mandarin.

The French squadron in the far East was immediately ordered to Siam, and the French representative at Bangkok demanded reparation. On June 15 the French occupied the island of Samit, off the coast; on June 17, the island of Rong; and on June 18, Rong Sam Len. When the French ships arrived at the mouth of the Menam, M. Pavie, the French minister, requested permission for 2 more gunboats to ascend to Bangkok, where the "Lutin" was anchored with decks cleared for action and machine guns mounted menacingly in her tops. Permission was denied, and the minister sent instructions to Admiral Edgar Humann not to enter the river. The Siamese had sunk junks in the river, closing the channel except a very narrow passage. They threatened to sink the French ships if they attempted to cross the bar. The minister's message did not reach Admiral Humann, whose officers, as night was falling on July 13, crossed the bar with the "Inconstant" and "Comète," notwithstanding the explosion of a submarine torpedo directly ahead of them. As he approached Paknam, where, under the treaty, French war vessels had an unquestioned right to anchor, a blank shot was fired from the forts, followed by a solid shot across the bow of the leading vessels. The French vessels forged ahead, steaming 10 knots an hour, while the forts and the 6 Siamese vessels kept up a constant fire for half an hour, which was returned by the French. Little damage was done, as it was growing dark. In the Siamese ships and forts 20 men were killed. One gunboat was rammed and sunk. The French lost 3 killed. The 2 vessels anchored alongside the "Lutin," opposite the French legation. The "Jean Baptiste Say," a French mail steamer that piloted the gunboats over the bar, was disabled by a shot from the forts, and run aground below Paknam to save her from sinking. On the following day the Siamese boarded and sacked and attempted to sink the vessel and maltreated the crew. A party from the gunboat "Forfait" boarded her to pull down the Siamese flag and save her from destruction, but was driven away. The French Government declared the Siamese authorities guilty of an unprovoked aggression in firing upon the French vessels, because the treaty of 1856 secures their right to ascend not only to Paknam, but with previous notification and an arrangement about anchorage also to Bangkok.

While these events were happening the Siamese made extraordinary efforts in the Mekong valley to check the French occupation and prevent the passage of gunboats. They massed troops on both sides of the Mekong near Kong, erected forts, especially on the left bank, and resumed the siege of the French forts on the island. Capt. de Villers, on July 14, to prevent the blockade, assaulted and captured the forts of Donthane and Taphan with a force of marines, losing 6 men and inflicting heavy losses on the Siamese. Subsequently he expelled the Siamese from their 4 forts on the islands of the Kong group by a series of assaults, in which they lost 300 killed. In the vicinity of Cammon the Siamese renewed their attacks on the French posts and were repelled. When the French ships had forced the passage of the Menam and menaced Bangkok the peace party at the court prevailed on the King to propose an armistice, which the French accepted. The Siamese agreed to withdraw their forces from Mekong valley.

On July 20 M. Pavie presented to the Siamese Government the ultimatum of France, in which she demanded the acceptance within forty-eight hours of the following terms: (1) The recognition of the rights of Annam and Cambodia to the left bank south of 23° of north latitude, and to the islands of the Mekong; (2) the evacuation within a month of the Siamese posts on the left bank of the Mekong; (3) satisfaction for the incident of Keng Chek and for the aggression upon the French gunboats in the Menam; (4) punishment of the guilty and reparation to the families of the victims; (5) an indemnity of 2,000,000 francs for damages caused to French subjects at various times; (6) the deposit of 3,000,000 francs to cover all claims or an assignment of the revenues of the provinces of Battambang and Siemriep or Angkor.

The Chinese *chargé d'affaires* in Paris informed M. Develle that Siam possessed no territory east of the Mekong as far north as latitude 23°. The Siamese Government signified its partial acceptance of the French terms, agreeing to deposit the sum demanded to cover indemnifications; to punish persons found guilty of acts of aggression against French citizens contrary to national or international law; and to regard as Annamite and Cambodian territory the left bank of the Mekong south of the northernmost point occupied by the Franco-Annamite troops, in latitude 18°, while the use of the islands should be common to Siam, Annam, and Cambodia. This reply was considered unsatisfactory, and M. Pavie left Bangkok with the three gunboats on July 26. The French Government notified the powers of its intention to blockade the coast of Siam without prejudice to other measures that might be taken to secure the rights of France. The British Government asked if there was a state of war, and announced that if a pacific blockade was intended British merchant vessels would not be required to observe it. The French minister explained that a pacific blockade was meant, and acknowledged, after some discussion, that the trade of neutral powers could not legally be interfered with. The blockade was notified by the French authorities on July 27 as beginning on the following day, three days being given to vessels to load and leave Bangkok. On

July 29 the Siamese minister in Paris, Prince Vadhana, informed M. Develle that Siam accepted all the terms of the ultimatum without reserve. This gave entire satisfaction to France.

As soon as France formulated her territorial demands the British Government intervened to claim a direct British interest in the districts on the Mekong north of Luang Prabang. The Burmese frontier touched the Mekong in its upper course. The Shan State of Kiang-Hung was considered a part of the former Burmese Empire, but it was claimed by China; the Indian Government had permitted the Chinese to occupy it, and would probably recognize their claim in order that the expense and danger and difficulty of preserving a continuous frontier between the Indian Empire and the French possessions in Tonquin. With the same object in view, the Indian authorities had ceded to Siam the southern Shan State of Kiang-Chang, which lies on both sides of the Mekong, on the condition that it should never be alienated. The French Cabinet agreed to the British proposal, that buffer states should be preserved or created, and left it to be decided by future negotiation as to what territories should be marked off and treated as a neutral zone, inviolable by both powers. The principle of a buffer territory had been already recognized in 1889, in an interchange of views regarding Indo-China.

In answer to the acceptance of the conditions offered, M. Develle, in a note dated July 31, demanded certain supplementary guarantees. Instead of undertaking to farm the revenues of the provinces of Angkor and Battambang, France would content herself with occupying the port and river of Echantabun until the complete evacuation of the left bank of the Mekong, but she demanded, for the purpose of continuing the good relations re-established with Siam and preventing a conflict in the neighborhood of Lake Tonlesap, that Siam should undertake to maintain no military forces in Battambang and Siemriep, nor within 25 kilometres of the Mekong river, and should also abstain from keeping armed vessels on the lake or on the Mekong. The French Government furthermore reserved the right of establishing consulates at Korat and Mungnan. On Aug. 1 Prince Vadhana accepted for his Government the new ultimatum.

Orders were immediately sent to raise the blockade, which had already disturbed the rice trade with Singapore and Hong-Kong. The blockade came to an end on Aug. 5, as soon as the preliminary treaty was signed at Bangkok, whither M. Pavie had returned. Le Myre de Vilers had already departed from France as a special envoy to arrange the details of the final settlement.

The treaty finally arranged by M. Le Myre de Vilers, in October, embodied the conditions of the ultimatum and supplementary demands and certain explanatory or additional stipulations. The French Government obtained the right to establish consulates not only in Korat and Mungnan, but wherever it may think proper. The Siamese Government is bound to open negotiations within six months for the revision of the commercial treaty of 1856, and for the special regulation of the customs and commercial system in the zone of 25 kilometres on the right

bank of the Mekong and the provinces of Battambang and Siemriep, where no regular or irregular armed force may be maintained and all existing fortifications must be razed. Meanwhile no customs duties will be established in this zone, to the products of which the French Government grants reciprocity. In these districts French subjects or political dependents have the right to travel about freely and do business on receiving passes from the French authorities. The French Government has the right to build docks and establish coal and wood depots wherever necessary on the right bank of the Mekong. In the appended convention it was stipulated that all French subjects, either Annamites, Cambodians, or Laotians, who were detained for any cause should be delivered up; that the Siamese posts on the left bank of the Mekong and the islands must be evacuated within a month; that a French representative should witness the execution of the sentence against the murderers of Groscurin and his men and the captors of Capt. Thoreux, and that if the penalties were deemed insufficient, the French Government might demand a fresh trial before a mixed tribunal; and that the French Government would continue to occupy Chantabun until the stipulations of the convention were executed.

SOUTH CAROLINA, a Southern State, one of the original thirteen, ratified the Constitution May 23, 1788; area, 3,750 square miles. The population, according to each decennial census, was 249,073 in 1790; 345,591 in 1800; 415,115 in 1810; 502,741 in 1820; 581,185 in 1830; 594,398 in 1840; 668,507 in 1850; 703,708 in 1860; 705,606 in 1870; 995,577 in 1880; and 1,151,149 in 1890. Capital, Columbia.

Government.—The following were the State officers during the year: Governor, Benjamin R. Tillman, Democrat; Lieutenant-Governor, Eugene B. Gary; Secretary of State, J. E. Tindal; Treasurer, W. T. C. Bates; Attorney-General, D. A. Townsend, succeeded by O. W. Buchanan; Comptroller, W. H. Ellerbe; Superintendent of Education, W. D. Mayfield; Adjutant-General, Hugh L. Farley; Railroad Commissioners, Jefferson A. Sligh, D. P. Duncan, H. R. Thomas; Chief Justice of the Supreme Court, Henry McIver; Associate Justices, Samuel McGowan, Y. J. Pope. Eugene B. Gary, the Lieutenant-Governor, was elected in December by the State Legislature to succeed Justice McGowan.

Finances.—Following is a summary of the accounts of the State treasury for the year ending Oct. 31, 1893: Total cash assets, \$227,728.55; net cash liabilities, \$494,906.42; total net liabilities, \$6,804,074.98; balance cash Oct. 31, 1892, \$201,748.90; total cash receipts during the year, \$4,208,456.30; total expenditures during the year, \$4,182,476.71; balance on hand Oct. 31, 1893, \$227,728.55. Among the receipts the State dispensary sales are credited at \$100,832.13, and among the expenditures the State dispensary is set down at \$134,493.87. The amount received for general taxes 1891-'92 and back taxes was \$735,411.03, and the phosphate royalty was \$233,544.33. The educational, charitable, penal, and sanitary institutions cost \$223,835.61; the militia, \$10,000; the public printing, \$23,932.45; elections, \$18,167.66.

The new 4½-per-cent. Brown consols were sold

in block to a syndicate. All the old bonds have been redeemed.

Railroads.—The total number of miles of railroad in the State is 2,552.45, and of this, roads aggregating 1,132.81 are in the hands of receivers.

Railroad Tax Cases.—The Governor issued a circular, Jan. 28, to the sheriffs throughout the State, directing them to seize enough personal property of the railroads to satisfy the claims of the State for taxes. These had been declared by the courts, in 1892, to be illegal. The sheriffs accordingly levied upon the rolling stock of such railroads, and chained cars to the track. After hearing the petition of the Richmond and Danville road concerning this "arrest of trains," Judge Simonton, of the United States Court, issued an order releasing all trains that have been tied up and restraining sheriffs from further interference with the property. This was ordered served upon the sheriffs, Feb. 8, by United States marshals.

In view of this order the Governor telegraphed to the sheriffs:

Where the amount of taxes in execution for 1891 and 1892 is less than \$2,000, hold the property to satisfy the execution unless it is taken from you by force. Then submit to arrest, and we will take the case to the United States Supreme Court on *habeas corpus* proceedings and make this Federal judge obey the decrees of that court.

On Feb. 16 injunctions were granted restraining sheriffs from interfering with the property of certain roads. The sheriffs of Aiken, Anderson, Abbeville, and Newberry Counties were adjudged to be in contempt of court for refusing to surrender the property when so ordered, and were each ordered to pay a fine of \$500 and stand committed to the custody of the United States marshal until this order be complied with. The Governor advised the sheriffs not to pay the fine, but submit to imprisonment, and he would then apply to the United States Supreme Court for a writ of *habeas corpus*. The case of the sheriff of Aiken County did so come before the United States Court, and the application was denied. The opinion said:

The seizure of the property by force was unjustifiable and could not be defended. The claims of the State for taxes are not superior to the general rule which makes property placed in the hands of a receiver subject to an order of court; they are to be determined in the regular way and proper manner.

The fines, costs, and fees, amounting to \$4,000 were then paid out of the Governor's contingent fund. The testimony as to the validity of the assessment was taken by the United States circuit court, in the summer and autumn, to be argued later. In an argument on the case in his message to the Legislature in November the Governor said:

Why should the Court obtain jurisdiction in the matter of taxes, which it could not otherwise pass upon, simply by reason of the receivership? Why should a bankrupt corporation obtain immunity from the State law when a solvent one can not obtain it? Why should a Federal judge throw the protecting arm of his great power around this class of property and give receivers special privileges which no other taxpayers can claim? If it is law, it is not right, and I think I can show it is neither.

Penitentiary.—The management of the State Prison seems to be very satisfactory from a business point of view. The report rendered in November showed that the profits for the past year exceeded the expenses by nearly \$24,000, and that the Penitentiary owned a fine lot of cattle and hogs, and was able to hold all its cotton for the best prices, not then having sold a pound. Many improvements have been made and paid for, including improved quarters for the officers and guards and electric power for the machinery.

Charities.—The report of the Home for Mothers, Widows, and Daughters of Confederate Soldiers has the following items: During the year there have been in the home 89 persons, of whom 68 were pupils of the school, receiving their board and tuition, 3 were officers of the domestic department, and 23 were permanent inmates.

The expenses of the year were \$6,190.68.

Education.—The Girls' State College, called the South Carolina Industrial and Winthrop Normal College, has been located at Rock Hill. The act establishing it provided that it should be built in the place making the best offer and affording the best advantages. Rock Hill is in the upper part of the State, near the foothills of the Blue Ridge mountains, has fine water and a healthful climate, and on account of its railroad connections is easy of access.

The building as planned will front 200 feet and extend back about 90 feet, with a large chapel in the rear. It will be 3 stories high above the basement, and will contain 40 rooms exclusively for school and industrial work, none of them for dormitories. In addition to ample provision for academic, normal, and industrial work, a good gymnasium and large society halls have been arranged for.

The Legislature gave \$50,000 for building a dormitory to accommodate 400 or 500 students.

The normal department of the institution has been conducted at Columbia in the past year as usual, having closed its seventh session in June. The expenditures amounted to \$4,281.98. In the seven years of its existence the college has sent out 157 trained teachers.

Clemson Agricultural College was opened on July 6. The sum of \$284,704 has been expended on the site, buildings, and equipment. The college will have about \$86,000 a year, and 301 students registered the first week. The maximum attendance during the year was 445.

The South Carolina College, at Columbia, seems to be still in a declining condition. The Governor recommended in his message that its doors be opened for girls, and that provision be made for normal training. The Committee of Ways and Means incorporated in the appropriation of \$25,000 to the college the provision that young women be allowed to enter, not lower than the junior class, at the next session.

A Great Storm.—The terrible storm and flood that devastated the southern coast Aug. 27 was most severe in South Carolina. The winds, coming from the east and southeast for hours together, drove in a great volume of water from the sea and heaped it up along the coast. At Charleston, according to the observations made by the local weather observer, the height of the resultant wave, as measured in protected areas, was about 5½ feet above mean high-water mark, which

was enough to flood all the lower levels of the city to nearly that depth. Near Beaufort the force of the wind was much stronger, the volume of incoming water was correspondingly greater, and the topography of the coast at that point enhanced the rise of the flood. St. Helena and Port Royal Sounds presented two large V-shaped openings to the east and southeast, into which the sea was swept without meeting any obstruction, and being concentrated in the narrower channels inland, rose to a still greater height in them and along their shores. The water in the river at Beaufort, well inland, rose 8 feet above spring tide, and waves 20 feet high rolled into the town. The low-lying islands and mainland about Beaufort were covered by a flood from the sea, the dead level of which was 10 feet above mean high-water mark.

Port Royal, Beaufort, and Charleston suffered severely, but the most complete devastation was on the Sea Islands. It was estimated that 1,000 lives were lost. The great majority of the dead were negro inhabitants of the islands. The growing crops were ruined by the salt-water flood, and the phosphate industry, the only other resource of the people of the islands, was paralyzed. The population of the islands is about 45,000. In Charleston the wharves were ruined, the battery was devastated, one church was almost wholly destroyed, and all the 70 churches were damaged. The loss of life there was comparatively small, not more than 6 deaths being reported. The whole loss in the region was estimated at not less than \$2,000,000. The Governor issued a proclamation asking help for the greatest sufferers, and assistance was promptly sent from other parts of the State and from other States.

For the relief of the sufferers the State Legislature made no appropriation, but it did extend the time allowed for the payment of taxes, and authorized Beaufort County to sell bonds. The Red Cross Association took in hand the region of Beaufort and the islands, where at least 80,000 people were to be provided for.

The State Dispensary.—The new law on liquor-selling went into effect July 1. Trouble in its enforcement began immediately and continued through the year. The first week in July an injunction was sought by citizens of Darlington to prevent the establishment of a dispensary, on two grounds. The first had to do with the petition and bond of the dispenser, which were alleged to be insufficient. The second was that the law itself was unconstitutional. Judge Hudson, of the Court of Common Pleas, before whom the action was brought, granted the injunction on both grounds. He took the ground that the law embraces two distinct acts of legislation: One prohibiting the sale of intoxicants by private individuals, which is within the scope of legislative authority, and therefore constitutional and valid; the other providing for a State monopoly of the liquor traffic, which is beyond the scope of legislative authority, and therefore unconstitutional and void. He said:

The police power can regulate the weight of bread, can insist on the inspection of meat and milk, can require the storage of powder, kerosene oil, or other explosive and inflammable materials within certain limits and in certain safe receptacles; and just so it can regulate the sale of intoxicating liquors, but it can

no more take possession of the trade in one of those articles of commerce than it can of the trade in any or all the others.

On an appeal to the Supreme Court the authorities obtained from Justice Pope a writ ordering a stay of the injunction, and permitting the dispensary to go on with business. Judge Wallace gave an opinion in favor of the law, since there is nothing in either the State or the national Constitutions expressly forbidding it.

The trouble continued through the year. As was expected, serious obstacles arose in the way of enforcing the law. In cases of supposed violations and consequent search, complaints were made that the law of personal liberty was disregarded, and private apartments were invaded. Still another decision was given by Judge Hudson in an action to enjoin a man from keeping and maintaining a place for the illegal sale of intoxicating liquors in Darlington, and to procure an order to search his premises, and to abate the nuisance alleged to have been created by him. Judge Hudson refused the order of injunction applied for, on the ground that the existence of the nuisance is doubtful and must first be established by the verdict of a jury; and refused the search warrant because it was a criminal process and wholly foreign to equity jurisdiction.

Similar actions arose in different parts of the State, growing out of efforts on the one hand to resist the opening of the State dispensaries, and on the other to detect and punish violations of the law by illegal sellers. Most important, however, were the cases against the railroads for receiving and delivering liquors in violation of the dispensary law. The decision in one of these cases, by Judge Simonton, was as follows:

Section 25 of the Dispensary act makes it a misdemeanor for the railroad employee to deliver any liquors from his train, and this without requiring any knowledge on his part that the package contains intoxicating liquors or that it is intended for sale. In every other instance mentioned in this section, including private carriers and railroad and express companies, knowledge that the intoxicating liquor is intended for sale is expressly required. This is a discrimination against one class of people—railroad employees—and is in conflict with the Constitution of this State, and so not within its police powers, and therefore not within the provisions of the act of Congress known as the "Wilson act." This being the case, the clause of section 25 of the Dispensary act, under which the petitioner was charged and arrested, is void under the Interstate Commerce law and the fourteenth amendment.

One of these cases involving the railroads came up in August, and continued in one phase or another into 1894. It was that of a dispensary agent, C. B. Swan, who seized a barrel of whisky at the freight depot of the South Carolina Railway in Charleston and took it to the sheriff's office. This railroad, being one of those in the hands of the United States courts, obtained an order against the agent in the United States circuit court, calling upon him to show cause why he should not be punished for contempt, and also be restrained from further intermeddling with the railroad, and from disposing of the property which he seized, and be compelled to return it whence he took it. He was acting under orders from the Governor. It was decided that he had no right to seize the property without judicial pro-

cess, and the order was given that he should remain in custody till he returned the property, and then three months longer as a punishment.

The State authorities obtained from the United States Supreme Court an order to the United States marshal to show cause why Swan should not be released on *habeas corpus* proceedings, and the case was heard in Washington in November. The decision, Dec. 18, was adverse to the State, and the agent was accordingly obliged to go to jail. Many other cases came up under the law. In some cases violent resistance was made to the constables' attempts at arrest and seizure; and in Spartansburg, in December, an attempt to arrest an alleged liquor seller led to an affray in which he was killed, and the officer dangerously wounded.

There was some doubt whether rice beer came within the meaning of the law, which allows the free sale of any beverage having less than 24 per cent. of alcohol, and the new bill passed by the Legislature of 1893 places it among the forbidden liquors.

The report of the State Commissioner, D. H. Traxler, rendered Nov. 27, gives the following summary of the business: Total expenses to Nov. 1, \$72,566.38; cost of merchandise, \$70,251.22. Appropriation, \$50,000; cash on account, \$100,332.18; leaving a balance of \$7,514.55. Total assets Nov. 1, \$143,225.69; liabilities—appropriation, \$50,000; bills payable, \$61,027.53; profits, \$32,198.16. It is explained that the difference between this account and the State Treasurer's was occasioned by warrants drawn by the Commissioner after Nov. 1 to cover October business.

Legislative Session.—The Legislature convened Nov. 28, and adjourned Dec. 23. There were 4 Republicans in the House, none in the Senate, and 120 Democrats in the House and 36 in the Senate. One associate justice of the Supreme Court and 5 circuit judges were elected.

Among the most important acts was the re-districting of the State. The object of the measure is described as follows by the Charleston "News and Courier," which is in opposition to the Governor and the prevailing Reform-Democrat party:

The scheme is designed to put all these people [the greater part of Beaufort, Berkeley, Charleston, Georgetown, Williamsburg, and Colleton] into a district with an overwhelming negro majority. They will be cut off by it from the rest of the State by lines of division which will compel them to accept a Republican and a negro as their representative in Congress. Their highest interests will be in his hands. The white people, the Democrats of the district, will have to look to him to speak for them in Congress on all questions touching their welfare.

An act was passed reconstructing the system of county government. The Governor is to appoint, upon the recommendation of the Senator and representatives from the county, 3 township road commissioners for each township—their terms of office to be coterminal with that of the Governor appointing them. The township boards of assessors and boards of equalization are abolished, and their duties devolve upon the county board of commissioners. Convicts sentenced to hard labor for not more than two years are to be put to labor on the roads in chain gangs.

The charter of the Port Royal and Augusta Railroad was repealed. Its affairs were taken into court in the winter of 1892-'93. The State authorities complained that the Central Road had been holding the Port Royal and Augusta for the purpose of keeping it from competing with Savannah and the Central system for business, and Gov. Tillman advised that, unless the road could be wrested from the control of the Central, its charter should be revoked.

A new dispensary law was made. It raises the salary of the State commissioner from \$1,800 to \$3,000. Any county, town, or city wherein the sale of alcoholic liquors was prohibited by law prior to July 1, 1893, may secure the establishment of a dispensary within its borders, on these conditions: A petition signed by one fourth its qualified electors will entitle it to an election, and if a majority vote at that election in favor of a dispensary, one shall be established. All profits, after paying all expenses of the county dispensary, shall be paid—one half to the county treasury and one half to the municipal corporation in which it may be located.

Clubs and like associations are debarred from keeping liquors for use, barter, sale, distribution, or division among their members; though the State Board of Control may exempt hotels where tourists or health seekers resort upon a bond in the sum of \$3,000 being given by the manager to observe the dispensary regulations. The provisions for disposing of the liquor are in the main like those of the law of 1892, but the regulations for enforcing the law are more stringent.

A new county was formed from parts of Edgefield and Abbeville, and named Greenwood. Acts were passed providing for a public printer, and establishing separate school districts for cities and towns. The law for the appointment of county boards of physicians to examine the diplomas of physicians and surgeons was repealed, and a State examining board with similar duties was established.

For the relief of the owners of phosphate plants destroyed by the cyclone of Aug. 27, in order to enable them to rebuild their plants and resume operations, the royalty on phosphate rock was reduced for a period of five years from \$1 a ton to 50 cents when the market price is \$4. When the price exceeds that figure, an additional percentage will be collected.

It was recently decided in the circuit court that South Carolina laws did not recognize the validity of a divorce obtained in another State, and that a divorced person who married again was a bigamist by the law of this State. A bill to remedy this was passed at this session.

It was resolved:

That it is the sense of this General Assembly that the United States Congress, now in session, ought to take decisive action at once, providing for the coinage of silver, as well as gold, as a standard money metal, and that the Representatives in Congress and Senators from this State be requested to use their best endeavors to restore the currency of the country to a bi-metallic standard.

SOUTH DAKOTA, a Western State, admitted to the Union Nov. 8, 1889; area, 77,650 square miles; population, according to the census of 1890, 328,808. Capital, Pierre.

Government.—The following were the State officers during the year: Governor, Charles H. Sheldon, Republican; Lieutenant-Governor, C. W. Herried; Secretary of State, Thomas Thorson; Treasurer, W. W. Taylor; Auditor, J. E. Hipple; Attorney-General, Coe I. Crawford; Superintendent of Public Instruction, Cortez Salmon; Commissioner of School and Public Lands, Thomas H. Ruth; Commissioner of Labor and Statistics, Walter McKay; Railroad Commissioners, E. F. Conklin, H. C. Warner, J. R. Brennan; Chief Justice of the Supreme Court, John E. Bennett, who died on Dec. 31; Associates, Alphonso G. Kellam, Dighton Corson.

Valuations.—The assessed valuation of property for 1893, as equalized by the State Board of Equalization, aggregated \$137,085,974, as against \$127,377,990 in 1892. The number of acres of land assessed was 15,849,036, an increase of 719,926 acres in one year. The total valuation placed upon railroad, telegraph, telephone, express and sleeping-car property was \$9,168,497. Included in the assessment were 295,042 horses, 554,193 cattle, 327,148 sheep, and 213,957 swine. The State tax levy for the year, as fixed by the board, was 2 mills for the general fund, 2 mills for the deficiency fund, $\frac{1}{4}$ mill for the bond interest and sinking fund, and $\frac{1}{4}$ mill for the special sinking fund—a total of 4 $\frac{1}{4}$ mills.

Legislative Session.—The regular biennial session of the Legislature began on Jan. 3 and ended on March 4. For the purpose of encouraging the construction of storage reservoirs for irrigating agricultural lands, an act was passed authorizing persons or companies to take and store away any unappropriated water from the natural streams of the State that is not needed for immediate use, and to construct ditches for carrying such water to and from such reservoirs. The owners of any reservoir, may also conduct water therefrom into and along any natural stream, and may take them out again at any point desired, without regard to the prior rights of others to water from such streams.

Another act provides that in civil actions cognizable by a justice of the peace, which are tried in the circuit or county court, three fourths of a jury may render a verdict. The introduction into the State of any armed police or detective force, or any armed body of men other than United States troops, for the purpose of suppressing violence was prohibited except upon application of the Legislature when in session, or of the Governor at other times.

The time in which property sold under a mortgage may be redeemed was extended to two years, provided that taxes and interest are paid at end of the first year by the mortgagor.

Telegraph, telephone, express and sleeping-car companies doing business in the State who fail to pay any State tax for thirty days after it becomes due are subjected to a penalty of 12 per cent. per annum upon such tax. The managers of the State Penitentiary were authorized to employ prisoners in the manufacture of binding twine, and \$8,000 was appropriated for purchase of machinery, stock, etc., to be used in this business. The mistake of the Legislature of 1891 in failing to provide for a State exhibit at the World's Columbian Exposition was corrected at this session, an appropriation of \$60,-

000 being made for this purpose. Authority was given for the levy of an annual State tax sufficient to pay interest on the \$100,000 of State bonds issued in 1890, and to create a sinking fund for their retirement in 1900. Provision was made for refunding \$62,000 5- and 6-per-cent. State bonds becoming due in 1893 into the same amount of 3½-per-cent. bonds. The bonds to be retired were originally issued in aid of the Agricultural College, the Territorial University, and the Deaf-Mute School. An additional hospital for the insane was located at Redfield, in Spink County, but no money was appropriated for the construction of buildings.

Three amendments to the State Constitution were proposed for submission to the people at the next general election. The first makes county superintendents of schools eligible for more than four years, the second allows women to vote for any school officer at any election at which such officer is to be elected, and the third amends section 4 of Article VI so as to read as follows: "The Legislature shall by general law limit and define the value and size of a homestead of each head of a family which shall be exempt from attachment or mesne process, and from levy and sale on execution, and from any other final process issued from any court, except upon the foreclosure of a mortgage or vendor's lien or liens for labor done or things furnished in the construction or repair of any building, erection, or other improvement thereon, and shall also provide for such exemption of a reasonable amount of personal property."

Other acts of the session were as follow:

Providing for inspection of private banks by the public examiner.

Authorizing county commissioners to offer a bounty for the destruction of pocket gophers.

Providing for the formation of co-operative building and loan associations, and regulating their business.

Abolishing dower and courtesy.

Amending the Australian ballot law.

Providing for a recount of ballots where a tie vote appears on the first count.

To prevent destruction of buffalo, elk, deer, antelope, and mountain sheep.

To prohibit the killing or capture of quail for five years.

To prevent oppressive garnishment and the transferring of claims for the purpose of depriving debtors of their exemption rights.

To provide for surveys of the geology, natural history, and physical features of the State.

To prohibit the dockage of grain.

Providing for a uniform insurance policy.

Providing for the organization of township mutual insurance companies.

To provide for the sinking of artesian wells, and for the levying of a tax to pay the expenses thereof.

Establishing a State board of pharmacy, and regulating the practice of pharmacy in the State.

Establishing a State board of medical examiners, and regulating the practice of medicine in the State.

Dividing the State into 3 districts, and providing for the election of a railroad commissioner in each district.

To provide for the construction of systems of sewerage in cities.

Providing for the employment of a State agent to prosecute claims of the State against the United States.

To regulate the shipment of cattle.

Amending the antitrust law.

Establishing a uniform system of weights and measures.

Education.—The number of children of school age in the State, as determined this year, was 96,774, an increase of nearly 6,000 over the figures for 1892. There was distributed to the counties from the State school fund income, for public-school purposes, a sum equal to \$1 for each census child.

On Oct. 15 the State suffered a loss of about \$100,000 by the burning of the main building at the State University at Vermillion. There was no insurance, and no money in the State treasury was available for rebuilding. The work of the institution was not interrupted, but will be conducted under great disadvantages for some time, as the next Legislature, which alone can authorize rebuilding, will not meet till 1895.

Indian Reservation.—On Dec. 31, 1892, an agreement was signed by the Yankton Sioux tribe of Indians and commissioners appointed under act of Congress by which the Indians agreed to cede to the United States a considerable portion of their reservation, comprising 430,405 acres of land between the Choteau and Missouri rivers. Of this tract, 167,325 acres have been already allotted and patented to the Indians under the act of 1887. The allotments made but not approved under the act of 1891 include about 95,000 acres more, so that the residue actually ceded includes about 168,000 acres. The Indians are to receive about \$3.60 per acre for this tract. A bill to ratify the agreement was pending in Congress at the close of the year.

Political.—The only State officers to be chosen at the November election this year were 3 justices of the Supreme Court. At a convention held at Huron the Independent party nominated the first ticket in the field, its candidates being J. B. Fairbank, C. B. Kennedy, and H. H. Porter. On Sept. 7 the Democrats, in State convention at Scotland, nominated Chauncey L. Woods, W. H. Stoddard, and Henry C. Hinckley; and on Sept. 20 the Republicans, at Huron, renominated Justices Bennett, Corson, and Kellam. Platforms, referring chiefly to national questions, were adopted at these conventions. At the election in November the Republican ticket was successful. The vote was as follows: Corson, 21,048; Kellam, 20,703; Bennett, 20,908; Fairbank, 12,608; Kennedy, 12,608; Porter, 12,903; Woods, 7,683; Stoddard, 6,701; Hinckley, 7,188.

SPAIN, a constitutional monarchy in south-eastern Europe. The Cortes is composed of a Senate and a Congress or Chamber of Deputies. The Senate consists of 57 members in their own right, including royal princes, grandees, and high functionaries, 123 life members appointed by the King, and 180 members elected by corporations and heavy taxpayers for ten years, one half of them being renewed every five years. The Congress has 430 members, 1 to every 50,000 people, elected for five years by electoral colleges. The crown is hereditary in the male and female lines of the house of Bourbon-Anjou. The king is Alfonso XIII, an infant, born May 17, 1886, whose mother, Maria Christina, an Austrian archduchess, was constituted Queen Regent during his minority.

The Council of Ministers, appointed in December, 1892, was composed as follows: President, P. M. Sagasta; Minister of State, Marquis de la Vega de Armijo; Minister of Justice, Montero Rios; Minister of War, Gen. J. Lopez Dominguez; Minister of Marine, Admiral Cervera; Minister of Hacienda, or Finance, G. Gamazo; Minister of Government, or the Interior, Venancio Gonzalez; Minister of Fomento, or Public Works, Commerce, and Agriculture, Moret Frendegast; Minister of the Colonies, Maura.

Finances.—The revenue for the fiscal year 1893-'94, is estimated at 787,476,858 pesetas, or francs, of which 290,423,473 pesetas are derived from direct taxes, 281,768,000 pesetas from indirect taxes, 129,940,000 pesetas from stamps and *régie* enterprises, and 22,874,880 pesetas from public property, and 12,470,000 pesetas were in the treasury. The estimated expenditure is 786,561,837 pesetas, of which the chief items are 309,219,669 pesetas for the debt, 183,372,215 pesetas for the army, 76,645,846 pesetas for public works and education, 54,650,000 pesetas for indemnities and pensions, 53,254,299 pesetas for justice, 26,544,829 pesetas for the interior, and 22,508,410 pesetas for the navy.

The capital of the public debt, which pays 4 per cent., was 5,962,043,090 pesetas on Jan. 1, 1893; interest for the year, 271,150,858 pesetas.

Commerce.—The imports for 1891 were valued at 1,018,771,000 pesetas; exports, 982,245,000 pesetas. The values of the principal imports were: Cotton, 85,022,000 pesetas; coal, 50,305,000 pesetas; timber, 42,990,000 pesetas; machinery, 38,802,000 pesetas; grain, 31,020,000 pesetas; tobacco, 30,271,000 pesetas; sugar, 30,230,000 pesetas; codfish, 28,580,000 pesetas; iron, 27,580,000 pesetas; woollens, 26,286,000 pesetas; spirits, 21,162,000 pesetas. The principal exports and their values were: Wine, 310,244,000 pesetas; lead, 61,980,000 pesetas; copper, 47,401,000 pesetas; iron, 43,439,000 pesetas; cork, 26,847,000 pesetas; shoes, 21,023,000 pesetas; animals, 14,924,000 pesetas; raisins, 14,459,000 pesetas; flour, 12,867,000 pesetas; quicksilver, 10,561,000 pesetas; grapes, 10,539,000 pesetas; almonds, 10,494,000 pesetas; oranges, 10,417,000 pesetas; olive oil, 10,227,000 pesetas.

Navigation.—The number of vessels entered in 1892 was 17,867, aggregating 11,585,712 tons, and the number cleared was 17,116, aggregating 11,579,217 tons. The mercantile navy on Jan. 1, 1893, consisted of 1,233 sailing vessels, of 196,660 tons, and 474 steamers, of 455,489 tons.

Communications.—The railroads in operation in 1893 had a total length of 6,710 miles. The post-office in 1891 carried 103,375,000 domestic and 15,184,000 foreign letters, 842,000 postals, and 74,670,000 newspapers, etc., besides 185,000 registered letters, containing 377,413,000 pesetas. The telegraphs, having a total length of 25,746 kilometres, with 56,512 kilometres of wires, transmitted 3,421,255 paid internal and 1,147,442 international dispatches.

The Army and Navy.—The law of Dec. 16, 1891, increased the annual recruit of the army from 49,000 to 80,000 men. The war effective is estimated at 203,000 foot and 21,000 horse. The peace strength of the permanent army in 1893 was 115,736 men of all arms.

The war fleet in 1893 was composed of 1

armor-clad turret ship of 9,902 tons, 3 armored cruisers, 8 deck-protected cruisers of the first class and 3 of the third class, 2 frigates, 13 unprotected cruisers, 47 gunboats of various sizes, 7 torpedo gunboats, 12 sloop gunboats, 1 torpedo catcher, 12 first-class and 3 third-class torpedo boats, 1 submarine torpedo boat, and 1 monitor. There were 2 turret ships lacking their armament, and in various stages of construction there were 2 armored frigates, 3 armored cruisers, 1 torpedo dispatch vessel, 2 torpedo gunboats, and 4 first-class and 20 second-class torpedo boats.

The Sagasta Ministry.—The Conservative ministry of Canovas del Castillo was defeated through a revulsion of virtuous indignation in its own party because it shielded some of its corrupt followers from punishment and because it showed no determination to correct the abuses that perpetuated the deficit in the budget. The Liberal leader formed a Cabinet of the most distinguished men of his party, taken from all sections, who were pledged to reform the budget under the guidance of a financial moralist who had pointed out the source and nature of the fiscal disorder. A dissolution was necessary to give the Liberals a majority. The Chamber consisted of 286 Conservatives, 96 Liberals, 9 Republicans of the Castelar group, 17 Advanced Republicans, 4 Carlists, 4 Ultramontanes, and several Cuban Autonomists. The general election took place on March 5, 1893, after all the officials had been changed and the usual measures taken to secure an overwhelming ministerial majority. The Conservatives and Moderate Republicans were allowed to elect respectable minorities, while the Government employed all the old devices to thwart the Extreme Republicans, only to find that under universal suffrage the vote of the industrial centers could no longer be constrained. The Liberals elected 322 members, the Conservatives 48 adherents of Canovas and 15 who follow Silvela, the Republicans 16 Moderates and 28 Extremists, and the Carlists 6 representatives. In Madrid 6 Republicans and 2 Ministerialists were elected. In the senatorial elections a few days later 7 Moderate Republicans were chosen by the universities and academies.

The Cortes were opened on April 5. The speech from the throne promised economies and increased revenue that would abolish the deficit of 70,000,000 pesetas. The Marquis de Armijo retired from the Cabinet to accept the presidency of the Chamber. Admiral Cervera had resigned a fortnight before because he would not consent to the reduction of the naval budget, and Admiral Pasquin was induced, on March 23, to accept the portfolio. Señor Gamazo encountered obstacles in every direction in attempting to carry out his programme of financial reform. The rigorous assessment and collection of the taxes which influential rich men have always evaded—the taxes on land, trade, mines, incomes, etc.—was a work requiring time and one which bristled with difficulties from the start. Retrenchment in every department was a plainer course, of which every one saw the necessity until it affected his pocket. The Queen Regent was willing to sacrifice 1,000,000 pesetas of the civil list, but the host of supernumerary officeholders and the 22,000 officers on the pay rolls of an army of 90,000 rank and file

fought to retain their salaries, and generally had influence enough with the party managers to prevail, although some of his colleagues loyally endeavored to carry out Gamazo's plans and insisted on resigning when they failed. The Minister of War, interdicted from cutting down the number of captain-generalships and compelled to allow extra pay to the few officers who were retired, could only economize by reducing the strength of the standing army. The Minister of Justice proposed to consolidate the district criminal courts, whereupon the lawyers struck and refused to plead. In his budget, presented on May 10, Señor Gamazo announced economies in all departments of 32,000,000 pesetas, besides 1,000,000 pesetas remitted by the Queen, and an increase in the revenue of 26,000,000 pesetas. He asked for authority to negotiate for a new internal loan of 700,000,000 pesetas at 4 per cent. for the purpose of paying the debt to the Bank of Spain and other liabilities. The Government dreaded the consequences of a Republican victory in the communal elections in May. To avert it, a bill was brought in postponing the elections till November. The pretext for this measure was that the Republicans had gained elections in the large cities by fraudulent registration and false returns, a statement designed to rebut the bitter complaints made by the Conservatives against the Liberals for permitting the Republicans to reappear in the arena of practical politics. The Republicans, incensed at the calumny and determined to frustrate, if possible, the plans of the Government to extinguish their constitutional movement, obstructed the bill, keeping the house sitting for fifty-four consecutive hours, until the legal date for the elections had come. The ministry postponed the elections arbitrarily by a royal decree, and, taking advantage of the momentary retirement of the Republicans to consult after the rejection of their substitute bill, called a vote against the protests of the Republican members who were left on guard, and passed the bill instantly by the almost unanimous vote of the members present, for none except the Carlists sustained the Republicans in their fight. The introduction of the bill was delayed until within two days of the communal election day because the House was not organized before, the ministers having consumed a month's time in futile efforts to produce legal grounds for unseating the Republican Deputies. For years Sagasta and his fellow Liberals had invited and urged the Federalist, Progressist, and Centralist Republicans to take part in the pacific and legal political contests and challenged them to show their electoral and legislative strength. They had formed a Republican coalition in the last campaign, had put forward their best men, an illustrious galaxy, outshining by their reputation for patriotism, rectitude, eloquence, and learning the chief representatives of both the great parties, and had organized their party so quietly that the Liberals and Conservatives were dumbfounded at their electoral success. Sagasta now showed that he was determined to stifle the Republican vote, and for this reason the Republican members, as soon as they returned from the lobby, announced that they would resign their seats, and left the hall in a body. Although it was late at night, the news spread through the city and 10,-

000 people gathered to cheer them until the crowd was dispersed by the police with drawn sabers. Castelar, who since the establishment of universal suffrage, trial by jury, and freedom of the press, has been a Liberal in everything excepting acceptance of the dynasty, announced his retirement from public life, while his lieutenants, Abarzuz and Almagro, with the Possibilist journals and committees, proclaimed their fidelity to Castelar's ideas of a peaceful Republican evolution.

Montero Rios, despairing of financial reform in his department and meeting with opposition to his plans in the Chamber, resigned on May 24, and on July 6 was succeeded by Ruiz Capdepon. Moret Prendergast, who took charge of Foreign Affairs temporarily, was confirmed in that post, though still retaining the portfolio of Public Works. On Oct. 15 Lopez Puigcerver was appointed Minister of the Interior in the place of Venancio Gonzalez, who retired on account of ill health. The prospect of saving in the army expenses was rendered remote by the operations in Morocco, but he succeeded in obtaining the consent of the Cortes to the main features of his reform of the antiquated territorial organization of the army. Instead of the numerous captaincies-general there will be 8 *corps d'armée* in Spain and detached divisions in the Canaries, the Balearic Islands, and Morocco. Of Gamazo's projects, including a readjustment of the alcohol and other duties, the abolition of the Court of Accounts and sinecures in various departments, the funding of the floating debt and of State pensions, and many other changes, some were abandoned and some were modified to accommodate the Conservatives or objecting members of his own party. The budget thus modified was approved in the beginning of August, and the Cortes were then adjourned.

A part of the Government programme affected the ancient privileges of the Basque provinces, and Republicans and Carlists joined in urging the Basques to defend their prescriptive rights. In San Sebastian, where the Queen was staying, the populace mobbed the band for refusing to play the Basque national hymn, "Guernicaco Arbola," and stoned the hotel in which Premier Sagasta was lodging and the troops that were called out to quell the riot. Additional troops were sent into the district to repress the incipient rebellion which threatened to develop into a civil war like that waged against the Government of Queen Christina by the Basque Carlists for the same cause. Sagasta, in his first ministry, had annulled the political *fueros* or special privileges of the Basques when they were weakened by the war, and now he had decided to annul their right, after the termination of the compact of 1886, to assess and collect the national taxes in their own way and pay the general sum into the treasury through their provincial authorities, and had informed the municipalities that henceforth they would be treated on the same footing as the rest of Spain.

In other provinces also opposition to the Government reforms took the form of defiance of the law. In Valencia, Catalonia, and Navarre, people refused to pay taxes or to allow others to pay. The new duties on wine, spirits, and tobacco were especially resented by the poorer classes.

Bomb Outrages.—In the early part of 1893 the police were rendered watchful by bold public demonstrations of anarchists in Barcelona and other cities and the spread of incendiary literature. On March 14 several of their dens were raided in Madrid, where they were preparing bombs. A gang was captured in a farmhouse near Xeres, where they were plotting vengeance for the execution of their comrades who were executed a year before. On June 12 a large torpedo was exploded in the plaza adjoining the palace in Madrid, and on June 20 one anarchist was killed and another wounded by the explosion of a petard in the garden of the ex-Premier Canovas del Castillo, who had offended by not pardoning the Xeres conspirators who were garroted on Feb. 10, 1892. The leader, Olves, escaped, but was arrested in Lisbon on Sept. 1. On Sept. 24, while Marshal Martinez Campos was reviewing the troops at Barcelona, a notorious anarchist named Pallas Latorre threw 2 petards under his horse, wounding him and 4 generals of his staff and several others and killing a policeman. Latorre, a typesetter by trade, did not join the fleeing multitude, but flung his cap into the air, shouting that none could call anarchists cowards when one attacks an army single-handed. An extensive plot was suspected, and the suspicions of the police were strengthened by the discovery of bomb factories and depositories in various cities. Latorre was tried by court-martial and shot on Oct. 6. The explosion of a cargo of 50 tons of dynamite in the harbor of Santander, which killed over 300 persons and destroyed buildings and shipping, was caused by an accidental fire. On Nov. 7, 2 large iron bombs of the kind used by Latorre were thrown from the gallery of the Liceo Theatre in Barcelona during the performance of an opera, one of which killed or fatally injured over 30 persons. Although more than a hundred arrests were made, a large bomb, of which the fuse was extinguished in time, was placed in the plaza a week later, where the people were gathered to cheer the troops departing for Melilla, and on the same day one was exploded at the gate of the barracks in the neighboring town of Villanueva.

The Spanish Government made overtures for an international treaty dealing with dynamiters, which were favorably received in Paris, but not in London. Among the arrested persons were prominent citizens of Valladolid and traders and members of the secret police of Barcelona. A society that planned and directed outrages in this part of Spain was found to exist at Mesina de Rio Seco, a little town near Valladolid. All the suspected anarchists were tried by court-martial, and hundreds were transported to the penal settlements.

Colonies.—Besides Cuba and Puerto Rico, Spain possesses the Philippine Islands, together with the Sulu, Caroline, and Marianne groups, having an aggregate area of 116,256 square miles and a population of 7,030,000, including 1,350,000 independent savages, and in Africa the island of Fernando Po and the dependencies of Annoboni, Corisco, Elobey, etc., having an aggregate area of 850 square miles and 30,000 inhabitants, besides the protectorate of Rio di Oro and Adrar, embracing about 243,000 square miles, with 100,000 inhabitants. Manila, the capital

of the Philippines, had 154,062 inhabitants in 1887. The budget of the Philippines in 1893-'94 makes the total receipts \$12,899,546 and the expenditures \$13,350,794. The imports for 1892 were valued at \$27,000,000; exports, \$33,479,000. The principal exports were Manila hemp for \$14,624,000; sugar, \$12,983,000; tobacco, \$2,034,000; copra, \$908,000.

For the expulsion of American Protestant missionaries from the Caroline Islands the United States Government demanded of Spain either a lump sum as indemnity or the restoration of their missions and effective protection and the full right to resume their labors.

STANFORD UNIVERSITY (officially designated as Leland Stanford, Junior University), an institution endowed by the late Leland Stanford, in 1885, in memory of his only son, then recently deceased at the age of seventeen. On Nov. 11 of that year Mr. and Mrs. Stanford executed a deed in trust in accordance with a general act of the State of California, passed March 9, 1885, legalizing and regulating all similar trusts for the advancement of learning and of the arts and sciences. The deed conveyed to Lorenzo Sawyer and 23 other associate trustees and their successors forever the following-named real and personal property: The Gridley farm, in the county of Butte, California, containing 21,000 acres, the value of which was \$1,500,000; the Vina farm, or ranch, in the counties of Butte and Tehama, containing 55,000 acres, of the value of \$1,800,000; the Palo Alto farm, in the counties of San Mateo and Santa Clara, containing 7,000 acres, of the value of \$2,100,000. This farm is devoted mainly to improving, training, and perfecting the breed of thoroughbred and trotting horses, of which there are 800 on the ranch. The water rights, water ditches, pipes, flumes, canals, aqueducts, and reservoirs used in connection with these tracts of land were included in the deed. The value has advanced materially since the date of the trust deed. Further donations by Mr. Stanford before his death, June 20, 1893 (see page 571 of this volume), made the endowment over \$20,000,000, and it is understood that the provisions of his will are to result in a total endowment of over \$30,000,000. This would readily yield an income of \$2,000,000, equal to that of Oxford University and superior to that of Cambridge. The donation of real estate was declared by the deed to be inalienable and to be devoted forever to the purposes of the trust, the rents, issues, and profits only being subject to the sale or disposal of the trustees. The trustees are required to make an annual report to the Governor of California, with a full account of their financial operations for the preceding year and a statement of the financial affairs of the institution.

Mr. Stanford's desire was to provide in California a place and means for practical education to fit men and women for the duties of life, yet without neglect of such measure of culture as may be essential to good citizenship. The preliminary clause to the trust deed declares that Mr. Stanford and his wife were desirous of promoting the public welfare by founding and endowing a university for both sexes with colleges, schools, seminaries of learning, mathematical institutes, museums, galleries of art, and

other things necessary and appropriate to a university of high degree. In that deed the purposes and objects of the institution are set forth thus:

Its nature, that of a university, with such seminaries of learning as shall make it of the highest grade, including mechanical institutes, museums, galleries of art, laboratories, and conservatories, together with all things necessary for the study of agriculture in all its branches and for mechanical training and the studies and exercises directed to the cultivation and enlargement of the mind. Its object, to qualify students for personal success and direct usefulness in life. And its purposes, to promote the public welfare by exercising an influence in behalf of humanity and civilization, teaching the blessings of liberty regulated by law, and inculcating love and reverence for the great principles of government as derived from the inalienable rights of man to life, liberty, and the pursuit of happiness.

All sectarian instruction at the university is absolutely prohibited both in the trust deed and in the act of the Legislature; but the immortality of the soul is taught, and the "existence of an all-wise and benevolent Creator, and that obedience to his laws is the highest duty of man." It was provided that a church should be erected, wherein the professors of various religious denominations shall from time to time be invited to deliver discourses not sectarian. The trust deed also provides that the rights and advantages of association and co-operation are to be taught in the university, not in the spirit of agrarianism, communism, or Nihilism, but subject to the rights of man as declared in the Declaration of Independence; that, for the protection of these rights in each individual, the combined force of the whole State should be used and exercised; that equal facilities and advantages should be given to both sexes; and that a farm shall be maintained on the Palo Alto estate for instruction in agriculture in all its branches. The following are the provisions that allow any person at any age to perfect himself in any special branch of science, mechanics, or agriculture:

1. To establish and maintain, in connection with the university, such a number of free scholarships as the endowment of the institution, considering all its objects, will justify. Such scholarships must be given either to those who, by good conduct and study, have earned the right thereto, or to the deserving children of those who, dying without means in the service of the State or in the cause of humanity, have a special claim upon the good will of mankind.

2. To fix the terms and conditions upon which the students generally may be admitted to all or any of the privileges of the university.

3. To fix the terms and conditions upon which the students of the public and private schools and other deserving persons may attend the lectures of the university, or engage in original research thereat, and the terms and conditions upon which the agricultural farms, laboratories, museums, art galleries, mechanical institutes, conservatories, and other institutions, part of the university shall be opened to deserving persons without their becoming students thereof.

4. To establish and have given at the university, by its ablest professors, courses of lectures upon the science of government and upon law, medicine, mechanics, and the other arts and sciences, which shall be free to the post-graduates of the colleges of the university hereby founded and to the post-graduates of all other colleges and universities and to all deserving persons, to the full capacity of the lecture rooms, under such rules and regulations as the trustees may adopt.

In 1886 the Palo Alto farm was made the site of the university. The railroad station of that name, 3 miles distant, is nearly 40 miles south of San Francisco. The site, containing 100 acres, is at the edge of the foothills on the eastern side of the Santa Clara valley. The prevailing style of architecture is an adaptation of the old California missions, low buildings with heavy walls and roofs of tile. The main group of 14 buildings incloses a quadrangle 600 feet long by 250 feet wide. These buildings are mainly intended as class rooms. They are of cream-colored sandstone, are 70 by 50 feet, and the height from the ground to the roof tree is 60 feet. The materials used in their construction were wholly the products of the State of California, with the exception of the tiles. The buildings open upon an arcade that runs around the whole quadrangle. The main entrance, covered by a lofty arch, is in the middle of one side of the quadrangle. On the opposite side is the museum, and on the west side the memorial church. The surface of the quadrangle is covered with a heavy coat of asphaltum pavement. Eight circular beds in the quadrangle are filled with semitropical trees and plants, which add greatly to the beauty of the scene. The separate dormitories for boys and girls are outside of the quadrangle. That for boys, known as Encinia Hall, is of sandstone, 5 stories high, with accommodations for over 300. The cost was \$400,000. That for girls, known as Robles Hall, is of concrete, 3 stories high, with accommodations for 100. Near the dormitories are the cottages of the faculty. These are so arranged that additions may be made to the group at any time, and it is expected that the majority of the professors will be domiciled there as well as many families of those who have children in the university. The museum contains many works of art that had been collected by Mr. Stanford. The plan includes the erection of a conservatory of music.

The requirements for admission are as follow:

Candidates must be at least sixteen years of age, and must pass satisfactory examinations in the following subjects:

General requirements: 1. English. 2. Arithmetic. 3. Algebra, including quadratic equations. 4. Plane geometry. 5. Geography. 6. American history. 7. Latin, including 4 books of Caesar, 4 orations of Cicero, and Latin prose composition, or German, or French. 8. Physics or any one of the subjects numbered 9 to 14.

Scientific requirements: Any one of the following to be passed before the beginning of the second year: 9. Mathematics, including advanced algebra, solid geometry, and plane trigonometry. 10. Free-hand drawing. 11. Chemistry. 12. Physiology. 13. Zoology. 14. Botany.

Language and Literature: Any two of the following to be passed before the beginning of the second year: 15. Latin, including 2 additional orations of Cicero, 6 books of Virgil, and Roman history. 16. Greek, including Book I of Xenophon's *Anabasis*. 17. Greek, including Books II-IV of the *Anabasis*, 2 books of Homer, Greek prose composition, and Greek history. 18. French. 19. German. 20. English literature. 21. History.

Students of mature age who are not candidates for a degree and who wish to pursue some one study and its related branches may be permitted to do so without having passed the usual entrance examination (excepting that in the English language) on recommendation of the professor under whom the specialty is to be taken.

For the present the certificates from high schools or academies credited or commissioned by the University of California or by the universities of other States will be received in place of examinations in the entrance subjects which they cover.

Students entering the university from other institutions of recognized collegiate rank will receive the standing to which their examinations or certificates may entitle them.

The baccalaureate degree will be granted to students who have successfully completed the equivalent of 15 lectures or recitations weekly for four years. These four years of work shall include as a major subject the entire course given by some one of the professors in the university, and as minor subjects such work in other departments as the professor in charge of the major subject may require as collateral work. These specified studies will amount to about one third in the nontechnical courses, and two thirds in the engineering courses, of the whole work required for graduation, the remainder being entirely elective.

All students, candidates for a degree, must take, either as preparatory or as undergraduate work, subjects 9 and 20, and also either 18 or 19, as enumerated in the entrance requirements above, with such work in rhetoric and composition as may be required.

The degree of Master of Arts (A. M.), Mechanical Engineer (M. E.), and Civil Engineer (C. E.) will be granted to graduates of this university and of other institutions of equal rank on the completion of an additional year of satisfactory work in residence at the university, in the department concerned, accompanied by an approved thesis embodying the results of independent investigation and research.

The degree of Doctor of Philosophy (Ph. D.) will be granted after the successful completion of an approved course of graduate study of not less than three years and the presentation of an acceptable printed thesis which shall embody the results of original research.

No degree will be granted to any person who has not spent at least one year as a student in residence at the university. No honorary degrees will be given.

The university was opened, with appropriate ceremonies, on Oct. 1, 1891, and Mr. Stanford delivered an address setting forth its objects. Addresses were also made by David Starr Jordan, president of the university, and Martin Kellogg, President of the University of California. The faculty has been gleaned with great care from the universities and colleges in the United States. Over 400 students matriculated on the opening day.

SUNDAY REST, INTERNATIONAL CONGRESS. An International Sunday Rest Congress met in Chicago, Ill., Sept. 28. Gen. O. O. Howard presided. An address of welcome was made by C. C. Bonney, of Chicago. In replying to it, the Rev. Dr. W. W. Atterbury related the history of the Sunday-rest movement, which originated in Geneva, Switzerland, about thirty years ago, under the leadership of Alexander Lombard, a banker, and also gave an outline of the scope of the congress, which aimed to present the Sunday question from all points of view, including the industrial, economic, social, and religious. Communications commending the work of the congress were received from Count Bernstorff, of Germany, who had been called home; the Netherlands Sunday Rest Association; the Glasgow Workingmen's Association; the Workingmen's Lord's Day Rest Association of England; M. Léon Say, of France; President Gompers, of the American Federation of Labor; and other representatives of trades and labor associations. Papers were read on "The

Physiological and Pathological Value of Sunday Rest," by Dr. S. B. Lyon, of the Bloomingdale Asylum; "The Legal Aspects of Sunday Rest," by ex-Senator J. R. Doolittle; "Sunday Laws," by William Allen Butler and Dr. H. W. Rogers; "Sunday in the Public Service," by Gen. O. O. Howard; "Sunday Post-Office Regulations," by the Hon. John Wanamaker; "The Sabbath in Judaism," by Rabbi Felsenthal, of Chicago; "Sunday Rest in Relation to Workingwomen," by Alice L. Woodbridge and Florence Kelly; "The Popular Desire for Sunday Rest," by Jane Addams and Mrs. Herrobin; "The Relations of Sunday Rest to the Fundamental Principles of Moral Life," by the Rev. O. Remier, of Paris; "The Place of Sunday Observance in Christianity," by the Rev. W. W. Atterbury; "The Lutheran View of Sabbath Observance," by the Rev. Dr. Spaeth, of the Lutheran Theological Seminary, Chicago, and the Rev. Dr. Heilman; "Recent Movements for Sunday Rest in Europe," by E. Deluz, Secretary of the International Federation, Geneva, Switzerland; "The Sacred Character of the Sabbath," by the Rev. Dr. Arthur Little; "The Right of Labor to a Weekly Rest," by George E. McNeill; "The Sunday Question in Great Britain," by Charles Hill, Secretary of the Lord's Day Rest Association of London; "Sunday Rest in French Industrial Establishments," by A. Gibon, of Paris; "The Work in Behalf of Sunday Rest in the Netherlands," by the representative of a society in that country; and the relations of Sunday observance to religion were further discussed by Cardinal Gibbons, the Rev. J. W. A. Stewart, Pastor Prunier, of Paris, the Rev. W. R. Huntington, D. D., the Rev. Joseph Cook, D. D., and other persons.

Sabbath Union, American.—The fifth anniversary of the American Sabbath Union was held in the city of New York, Dec. 10 to 12. The Rev. George S. Mott presided. The general secretary presented his annual report, embracing items of interest from 80 affiliating Sabbath associations and Sabbath committees. It defined the aim of the Union as being to unite the Sabbath-loving citizens of the republic in concentrated movements for the protection of the Sunday, which was incorporated in the civil structure at the beginning by our forefathers. The Union embraces fourteen Christian denominations, and is heartily approved by many statesmen, civilians, and wage earners. "The masses now," the report continues, "irrespective of race or creed, are studying as never before the Sabbath question in its social and economic bearings. The laxity of many Christians in reference to the sacred observance of the Sabbath is, to the best leaders of Christian thought, an alarming fact, and the Church is becoming aroused to a sense of her obligation."

Resolutions were adopted recognizing the indebtedness of the society to its late President, Col. Elliott F. Shepard, recently deceased; recommending the observance of the first week in April, 1894, as a special season of prayer throughout the world for the preservation of the Sabbath; offering thanks to God for the vindication of the Sabbath at the Columbian Fair, as manifested in the face of opened gates, in "the covered exhibits, the meager attendance,

the conspicuous absence of workingmen, the unmistakable opposition of public sentiment, together with the financial loss entailed by Sabbath opening"; regarding the publication and circulation of the Sunday newspaper "a most subtle and dangerous agency for the secularization of the Sabbath, inasmuch as it destroys the respect of its readers for the divine command, deprives a multitude of laborers of their weekly rest day, and proposes to make money by its publication on the day upon which it is unlawful to carry on worldly business"; and appealing to pastors and members of churches and all order-loving citizens not to patronize any paper issued on the Lord's Day, either by purchasing or advertising. A number of addresses were delivered during the meetings on subjects relating to the American Sabbath and its faithful observance.

SUNDAY SCHOOLS. International Convention.—The International Sunday-School Convention is the body which has the charge of the Uniform International Sunday-School Lessons now used in the Sunday schools of the majority of Protestant denominations throughout the world. It meets every three years. Its first meeting was held in Baltimore, Md., in 1875. Subsequent meetings have been held in Atlanta, Toronto, Louisville, Chicago, and Pittsburgh. The seventh meeting was held in St. Louis, Mo., beginning Aug. 30. The Hon. J. I. Harris, of Alabama, presided. Statistics were presented showing that there were in the United States 121,797 Sunday schools, with 1,908,254 officers and teachers and 9,688,596 pupils; in the Dominion of Canada, 8,086 Sunday schools, with 67,142 officers and teachers and 557,228 pupils; and in Newfoundland and Labrador, 314 Sunday schools, with 2,162 officers and teachers and 22,817 pupils. The report of the Lesson Committee showed that by the end of the coming December the schools would have gone three times through the Bible since the institution of the International system of lessons, under which it was intended that the whole book should be reviewed once every seven years—not continuously, but in such a way and with such selections of passages as should give a clear idea of the thread of the Bible story and a presentation of the essential doctrines taught in it. Its contents had been covered as fully as possible within the limit assigned. Of 1,031 lessons provided during the past seven years, 461 had been from the Old Testament and 570 from the New Testament. In reply to criticisms that had been made of the lessons, the report said:

As to the complaint that our system does not furnish a sufficient amount of denominational teaching, our reply is that the difficulty must be with the teachers, and not with the lessons. If these denominational teachings have not been included in the International Lessons, it is because they are not in the Bible. The whole Christian world may be challenged to point out a clearly revealed biblical doctrine which has been avoided or omitted. It is true we have not arranged the lessons so as to teach any peculiar system of theology, or to prove any denominational declaration of faith. That work we have left entirely to expositors and teachers, for catechetical instruction and supplemental lessons. But the proof texts for all the essential doctrines found in the Bible are included in our lessons. It has been very truly said by one in no way connected with our committee that the Inter-

national Lessons conform to the "plan of the Bible as a book of books, rather than to a system of doctrines, or to a series of duties, or to any central truth." As the "Sunday School Chronicle" of London well expressed it, "Our International system is based on the idea that the moral and religious principles embodied and illustrated in the Bible are the proper subjects of Sunday-school teaching."

Resolutions were adopted recognizing that the International system had stimulated Bible study to a degree never before known; had placed "the richest intellect and the latest acquisition of Bible knowledge in the hands of the common people"; and had developed and deepened the Christian brotherhood and fellowship; affirming belief in it as being, all things considered, the most practical system for Sunday schools generally; urging adherence to it; and relieving the International Lesson Committee from the instructions hitherto given excepting those providing for a temperance lesson every three months.

World's Convention.—The meeting of the International Convention was followed by that of the World's Second Sunday-School Convention in St. Louis, Sept. 4. A chart suspended over the platform gave the following as the numbers in Sunday schools in the nations mentioned other than the United States. The exhibit is not complete, for Australia and several missionary lands are omitted:

France—Sunday schools, 1,456; teachers, 3,800; pupils, 60,000; total, 63,800.
 Germany—Sunday schools, 5,900; teachers, 34,963; pupils, 749,786; total, 784,769.
 Switzerland—Sunday schools, 1,637; teachers, 6,916; pupils, 113,382; total, 120,298.
 Belgium—89 Sunday schools; 310 teachers; 4,112 pupils; total, 5,422.
 Austria—212 Sunday schools; 513 teachers; 7,195 pupils; total, 7,708.
 Finland—6,858 Sunday schools; 11,534 teachers; 147,134 pupils; total, 158,668.
 Denmark—508 Sunday schools; 3,043 teachers; 55,316 pupils; total, 58,359.
 Norway—550 Sunday schools; 4,399 teachers; 63,980 pupils; total, 68,379.
 Portugal—11 Sunday schools; 56 teachers; 1,066 pupils; total, 1,122.
 Newfoundland—359 Sunday schools; 2,275 teachers; 22,976 pupils; total, 25,251.
 India—5,548 Sunday schools; 10,715 teachers; 197,754 pupils; total, 208,469.
 Italy—Sunday schools, 403; teachers, 654; pupils, 10,969; total, 11,623.
 Ireland—Sunday schools, 3,584; teachers, 27,740; pupils, 308,516; total, 336,256.
 Canada—Sunday schools, 8,336; teachers, 68,348; pupils, 664,228; total, 682,576.
 Scotland—Sunday schools, 6,275; teachers, 62,994; pupils, 694,866; total, 757,854.
 England and Wales—Sunday schools, 37,201; teachers, 585,457; pupils, 5,976,357; total, 6,561,994.

The Rev. B. F. Jacobs, of Illinois, was chosen president of the convention. Addresses were delivered concerning "Sunday-Schools in Connection with Missions," "The System of Home Bible Study," "The Bible," "The Teacher's Work," "The English System of Systematic Visitation of Sunday Schools," "The Examination of Teachers and International Diplomas," "Normal Sunday-School Work," "Primary Work," and "The International Bible-Reading Association."

SURGERY AND MEDICINE, RECENT ADVANCES IN.

The discoveries of the ninth decade of the century inaugurated an amazing epoch in the development of the medical sciences and of the art of healing. It has been like a sunrise, but its sun is not yet half above its horizon; and great as the achievements have been in both science and practice, it is universally felt that they are but as dawn to high noon in comparison with "the promise and potentiality" of the vital secrets now opened and opening before the medical profession. The development of micro-biology under the lead of Pasteur and Koch has made of pathology a new science, and laid the foundation of a new art of healing. Although the first enthusiastic expectations of victory over that almost ubiquitous demon of disease, the microbe, have been damped, and even its true relations to disease are in dispute, it is undisputed that careful specialists have used the new knowledge to good purpose as an auxiliary in the treatment of plagues like consumption, Asiatic cholera, diphtheria, etc.; while the vantage acquired through bacteriology for tracing their sources, arresting their spread, and repelling their invasions needs only to be universally employed, as it is beginning to be in some places, to make an enormous reduction in the bills of mortality. The Pasteur Institute of Chicago reports a total of 230 patients bitten by undoubtedly rabid animals, besides 72 strongly suspected, with only one case of hydrophobia; and this corresponds closely with the results in Paris, New York, and other cities where the treatment has been established. But the most decisive results thus far attained through the science of bacteriology will be noted further on in the department of surgery, after mentioning important medical applications recently made of certain other modern sciences. Among these, electricity and phonography are doing valuable service in diagnosis. The illumination of the internal cavities and passages of the body by the electric light, together with optical apparatus for their observation from without, now often enables the physician or surgeon to proceed with certainty and promptitude where of late he would have had to act upon imperfect knowledge, upon doubtful conjecture, or after too long awaiting of developments. Interior auscultation by means of a conductor analogous to the common speaking tube (aided, perhaps, by the macrophone) affords further aid by more accurately detecting or distinguishing symptomatic sounds of the heart, lungs, and some organs which have never before given testimony to their condition in this way (Dr. Benjamin W. Richardson). At the same time the phonograph records these audible indications, both of the original and succeeding conditions of a case, for the most deliberate and critical consultation that may be at any time desirable (Dr. J. Mount Bleyer, New York). Electricity as a stimulant and as a reducer of morbid growths has advanced notably of late into scientific handling by cautious and discriminating physicians. A great number of potent antiseptics, antipyretics, anæsthetics, and anodynes have been added to the pharmacopœia, exciting sometimes high expectations by their remarkable powers, but their realized utilities have been mostly con-

fined to preventive medicine and surgery, where some of them are essential factors in achievements that seem to approach more nearly to the miraculous than perhaps any others in the history of human progress.

The most substantial and unequivocal progress in the healing art proper, and that which is indeed truly wonderful and novel, is found not in the administration of drugs, or even of hygienic regimen (though something might be claimed in each of these directions), but in the discovery or more extended application of methods for supplying or supplementing the grand physiological process which is the practical basis of life, and therefore of successful resistance to disease. To build against the waste and destruction of disease is the great medical achievement of the present and, so far as can be seen, of the future. Heretofore the best that had been known on this line consisted in assistance to the digestion, assimilation or absorption of nutriment, by means of preparations of food predigested or otherwise specially adapted, together with artificial or natural digestive ferments and stimulants, and, above all, the impartation of motion to all tissues and fluids by mechanical massage, exciting tissue nutrition by tissue waste and circulation. It is to be placed, in passing, to the credit of the immediate period under survey, that the invaluable agency of massage, as applied mechanically by Drs. George H. Taylor and George H. Patchen, of New York, is much more widely recognized than ever before; and also that nutriments of peculiar value, for patients who are not past assimilating food, have been provided in forms available everywhere and for all. But the vital discovery of the day, not to be ranked with mere improvements, however ameliorative, is the importation of vital fluids in their living state from the systems of the most vigorous animals to supply corresponding deficiencies in the sick and even moribund human subject. Extracts of the nerves and of various glands (chiefly the reproductive) have shown too much promise and held their own too well in the practice of Drs. Brown-Séquard, William A. Hammond, and others, to be passed entirely without notice, although the extent of their utilities remains in question.

Hæmotherapy.—The one really established "rejuvenator" now finding its way into degenerating or failing tissues of every kind, and under almost unlimited conditions of disease, is the *living blood cell, or corpuscle*. Transfusion of blood from one person to another had long ago been resorted to with success in cases of extremity, but the conditions necessary for this process are rarely available, and the process at best would scarcely be applicable to one in a thousand of the cases where the vital blood element is now found to be the effectual desideratum. This kind of cases has rapidly grown to a multitude, and multiplies with every day's experience, demonstrating a range and power of cure beyond all comparison in the previous history of medicine. Space here would fail to catalogue the conditions in which the live blood extract (designated commercially as bovine) is already applied with results incredible until witnessed. The corpuscles having been preserved unchanged

from their vital condition in the arteries of the bullock, and all germs casually attendant having been sterilized from the first, the containing liquid is injected into subcutaneous tissue, into veins, into arteries; is absorbed by the raw surfaces of wounds or sores of every kind, or enters the circulation by the absorbents of the stomach or any part of the intestines to which it can be applied, with all the effect of a natural enlargement on the spot, of the volume and vigor of the blood, taking up its tissue-forming and disease-expelling office at once in the part affected, and to which it is applied, while employed at the same time as a supplement or even substitute for alimentation, to build up and invigorate the system through the general circulation. The applications that have been made of this "elixir" have developed degrees and modes of vital efficiency in the blood that were before unsuspected—this more especially in surgical cases hitherto nearly intractable—while the *practicability* of supplying its power effectually to combat local lesions and the moribund condition resulting from exhaustion by disease, hæmorrhage, etc., is no less a complete revelation to medical science. A person in *articulo mortis* from surgical or childbirth hæmorrhage, or from exhaustion by fever accompanied with inability to retain a drop of any kind of nourishment, medicine, or even stimulant for days, is a kind of case reported by hundreds in the recent practice of physicians who have successfully come to the rescue with bovine supplied to the blood by any available way of access, as per rectum, or even by subcutaneous injection when no other access was practicable or adequate to the emergency. The degree of uniformity and certainty in which a sort of resurrection is effected in such cases is as far beyond precedent in medical experience as the almost miraculous efficacy developed in the application, topical or general, of the blood extract.

In surgery the fatal collapse from hæmorrhage—and also in medical practice the collapse of cholera, typhoid fever, etc.—had been recently remedied by subcutaneous or arterial infusion of slightly saline water, sometimes as much as a gallon being thus thrown into the circulation within a few minutes. Still later, the more normal and substantial re-enforcement of the circulation by bovine has been employed in collapse with the most admirable effect, and promises very definitely to be not only a sovereign resource for the surgeon, but a means of carrying many patients safely through the last and desperate stage of Asiatic cholera, etc., and, still better, of preventing that stage by a timely supply to meet the drain of the serous diarrhœa, not only filling the empty blood vessels, but filling them with tissue-building blood. Not to dwell, within our narrow limits, on the numerous applications of this vital agent that might be cited, the leading line that it has happened to take thus far must be more particularly noticed, viz., the cure of wounds and ulcers. The earliest discovery of this power was made by Dr. W. H. May, of New York, in 1888, by experiment on a desperate ulcer of three years' growth, 4 by 6 or 7 inches in dimensions, deep in the muscular tissues of the leg, and found proof against all agents then known for checking its continual

encroachment and growth. His method was that of hypodermical injection of bovine at a number of points around the circumference of the ulcer, and about an inch from its margin. The entire ulcer was expelled and supplanted by sound flesh within three months from the beginning of this treatment—a mere experiment, and the first ever made. Since then several physicians have vanquished this all but incurable kind of disease by the same agent, but latterly without the painful and tedious injection process, which has been discarded for most cases in favor of direct application of bovine to the interior of the sore, after due cleansing. The record by 1 physician of 335 ulcers (indolent, syphilitic, varicose, and tuberculous) shows 95 per cent. of completed cures. (Inflammation, however, must be subdued by other treatment before applying bovine, which otherwise would aggravate the case by the active increase of local nutrition which it sets up. The removal of the morbid products and sterilization of the part must also be carefully performed, in order to a free absorption of the blood extract without deterioration from contact with the acid discharges.) The treatment of cancers has been initiated with gratifying success in the superficial class (epithelioma), and sarcoma is thought without doubt to be equally amenable to the blood treatment, where it is accessible. It is thought quite possible that like success may be had with cancer of the organs when in accessible position and stage of development. Phthisis, or tuberculosis of the lungs, being an ulceration that is readily overcome by the blood treatment when occurring in external parts, has also been attacked on the same principle with encouraging, indeed surprising, effect by Dr. T. J. Biggs, of the New York Polyclinic. Bounds can not be set at present to the range of beneficence opening before this truly epoch-making discovery in medicine. Its place in operative surgery has already extended to the treatment of injuries and diseases of both muscle and bone which must otherwise have been disposed of by amputation; cases of which, attended with wonderful success, might be cited in detail did space permit.

Operative Surgery.—In operations on the abdominal organs and the brain, it is needless to remark, modern surgery has startled and thrilled the world with its later triumphs. Bacteriology and antisepsis—or asepsis, which if actual comes to the same thing or better—are the twin pillars of our operative progress, buttressed on either side by anæsthesia and bovine injection. Intestinal tumors and lacerations are now cut out of the opened abdomen and the wounds sewed up and healed, by thousands on thousands, with less danger than lately attended the amputation of limbs. The stomach and liver have each been successfully cut partly away in the removal of tumors. The bladder and the female organs are extirpated and dispensed with when necessary. The diseased larynx is removed, and replaced with an artificial substitute by which intelligible speech is effected. The lungs have been relieved of diseased portions by the knife and healed. Nerves, great and small, as well as muscles, tendons, and bones, are resected or removed, replaced or reunited, and repaired in a serviceable manner.

The entire leg is amputated at the hip joint by one or more established operations, notably Wyeth's and Senn's, without danger of the hæmorrhage which had been oftener than otherwise fatal. Internal ailments, too obscure for clear diagnosis, are unhesitatingly investigated with the knife if necessary. The perils and horrors of childbirth in cases where a small pelvic orifice or an overgrown fœtus absolutely prevent delivery are substantially done away by the impunity which perfected asepsis and anæsthesia afford in Cæsarean section, and in a newer operation performed with greater ease and less injury, symphysiotomy, namely—separating the pubic bones at the symphysis, and pressing them sufficiently apart. The bones grow together again without difficulty, and there seems no reason why bovine sponge-grafting or transplanted bone might not fill the gap and allow adequate passage for future deliveries without a second resection.

Fortified with modern operative impunity, and guided by the map of the brain with its branches and distributive functions so far as made out by the investigations of vivisectionists, the surgeon attacks tumors, abscesses, hæmorrhages, etc., inside the skull with as direct and certain aim in most cases as if the brain had no covering; removes or repairs them, and patches up both skull and scalp as good as new. To be more explicit, the greater number of symptoms produced by lesions in the brain indicate unerringly to modern science, by their character and the parts and functions affected, the precise area of the brain from which the disturbance proceeds, so that the surgeon can lay his finger over the hidden sarcoma, abscess, blood clot, or whatever, and cut down to it as confidently as a navigator would steer for a port or past a sunken rock by his chart.

By exploring the uncovered brain of the living monkey with the stimulus of the electric battery, and noting the exact muscular motions so produced from each point in the brain, it has been found practicable to define the precise area of the brain from which each of the motor impulses proceeds, also the areas that control most of the senses, and the areas concerned in some of the mental faculties and emotions, such as recognition of the uses of objects physically perceived. The mental expression of animals is so obscure to us that little further progress in phreno-topography may be expected from animal vivisection. But the great number of human vivisections now performed for the relief of cerebral and nervous troubles, epilepsy, etc., will incidentally and gradually reveal at length the knowledge that is wanted to enable us to go to the root of many a disorder now mysterious, under the guidance of morbid mental phenomena which will have been tracked to their several lairs in the brain, and forms even of insanity that can be extirpated or laid open to therapeutic treatment by the surgical armament will be brought to light in growing numbers, and will be vastly better understood. Some of the mental processes related to sensation have already been located, but much remains to be done by observation on the regular line of surgical practice, or "human vivisection," before the phreno-topographic chart of the brain will be so complete that brain surgery can "have its perfect work." Among pion-

eer explorations for the centers of mental action in the brain, the most satisfactory as yet is the location of certain mental processes connected with sensation, including the recognition of objects seen (or what is called psychical sight) in a small convolution of the brain known as the angular gyrus. By means of this datum the celebrated surgeon MacEwen, of Glasgow, cured a case of melancholia with homicidal impulses which had originated in an injury of the skull. Among other consequences of the accident, the patient had been unable to recognize the use or nature of familiar objects which he distinctly saw, although he could still recognize it fully through the sense of touch. Taking, therefore, the angular gyrus for his guide, MacEwen cut out a button of bone from over it, and found on the inner side a splinter that had been struck off from it and had been pressing, partially imbedded, on the precise area of "psychical sight." This having been removed, the patient's intellectual infirmity disappeared, and with it also the impulse to kill his wife and children.

Epilepsy, by its marked motor symptoms, has guided the surgeon to its centers in the brain in hundreds of operations already, and with generally very beneficial, though more rarely decisive, results. The initial movement of the fit is taken for a guide; and if the electrical test on the corresponding motor area of the brain produces the epileptic fit as well as the characteristic movement, the extirpation of that area, accurately defined, proves a curative success. Otherwise it is necessary to explore farther to find the source of the coincident symptoms. In a case (reported by Dr. W. W. Keen, of Philadelphia, among other valuable data herein employed) of epileptic attacks which always started in the right thumb, it was sought to define precisely the extent of the thumb center in the brain by cutting out a button from the skull of an inch and a half diameter (covering the hand, arm, and face centers), and then stimulating the brain from the electrical battery at different points and noting the effects on different muscles until, point by point, the exact area for each set of muscles was circumscribed, precisely as the animal vivisectionists had made the original discoveries. The thumb center thus accurately delimited was found to be about half an inch square. It was excised, the exactitude of the operation being tested by the means before used. The immediate effect was the typical epileptic fit, together with complete paralysis of the muscles of the thumb—five groups, certain of which extend well up toward the elbow—without in the least affecting any other muscles. In a few months the muscles of the thumb also recovered their functions. Whether the removed thumb center had been repaired by a fresh growth is uncertain. It has been reported, in a case of injury to the left side of the head which impaired the dexterity of the right hand, that the right motor center came to the rescue, concentrating faculty in the left hand to the full extent of the impairment in the right. This would seem to show, at least, that the usual inferiority of the left hand is merely the result of one-sided exercise of the hand centers in the brain.

In a recent case of Dr. J. W. Kime, United States army surgeon at Fort Dodge, Iowa, where

the skull of a boy had been violently crushed out of shape and large fragments of it driven into the brain, the fragments were raised and in part removed, the lacerated brain scraped out by the teacupful, and the whole so repaired that in time the vacated and denuded space was refilled with fresh tissue, and covered again with new bone, and the faculties resumed their operations apparently unaffected.

One of the strangest surgical operations that the human head has been proved capable of enduring is the opening and enlargement of the skull of microcephalous, and therefore more or less imbecile, children. It is called Lannelongue's operation, from its audacious originator, but has been improved and performed with remarkable success, in the development of the faculties, by Wyeth and other American surgeons. In this operation the skull is sawed open from front to back and the separated halves are forcibly pressed apart until the brain is released from the constriction under which it had been dwarfed, and given reasonable space for future growth. Artificial or transplanted bone is supplied to the gap, or else a protective cap is fitted on while Nature makes the repair. In ordinary modern trephiny it is only necessary to push back the button, and Nature does the rest.

Sanitary Progress.—This is a short chapter, so far as recent discovery is concerned, although progress of late years in the application of what is known has been considerable, and the proposals of progress now struggling to birth in practice promise immense results, particularly through the isolation of consumptives and disinfection of their quarters as in other infectious diseases, and the rigorous sanitary control of cows, from the milk of which animals, in their domesticated and inbreeding conditions, it is believed that consumption generally, and typhoid frequently, have been propagated.

In the great and paramount matter of water sanitation, also, the progress of recent years has been entirely in extending the practice of previously discovered methods. Of these, the perfect sanitation of drinking water by the Hyatt filter (when properly used) is central, and indeed all-sufficient. The adoption of this defense against malign organisms and organic contaminations in water has lately extended considerably in private and corporate establishments, inasmuch that the consolidated companies now peacefully enjoying together the use of the Hyatt patents are reported to be making money.

The great question of sewage disposal continues in the unsettled and unsatisfactory condition of old, between irrigation and precipitate filtration, which should probably be tried in combination, the reduced sludge being plowed into cultivated soil. The sewage of the World's Columbian Exposition was solidified by the Shone system, and consumed in the Engle Garbage Cremator with the garbage and other waste of the premises, the whole averaging over 40 tons per day, at a cost, as officially reported, of but 60 cents per ton, and without the slightest exhalation, offensive or otherwise, appreciable by the senses.

SWEDEN AND NORWAY, two kingdoms of northern Europe united by the treaty of Kiel, concluded on Jan. 14, 1814, under one

sovereign. King Oscar II, born Jan. 21, 1829, is the grandson of Marshal Bernadotte, Prince of Ponte Corvo, who became King in 1818 under the style of Carl XIV.

Sweden.—The legislative power is vested in the Riksdag or Diet, composed of two Houses, of which the upper, consisting of 147 members, is elected by the provincial and municipal bodies, and the other, containing 228 members, by all qualified voters.

The executive power is exercised by the sovereign on the advice of the Council of State, which in the beginning of 1893 was composed of the following members: Minister of State, Erik Gustaf Boström; Minister of Foreign Affairs, Count Carl Lewenhaupt; Minister of Justice, August Ostergren; Minister of the Interior, Victor Lennart Groll; Minister of Finance, Baron Fredrik von Essen; Minister of Education and Worship, Gunnar Wennerberg; Minister of War, Baron A. E. Rappe; Minister of Marine, Baron C. G. von Otter; ministers without portfolios, Baron A. L. E. Akerhielm and Sven Herman Wikblad. During the year Admiral J. C. E. Christerson succeeded Baron von Otter as Minister of Marine and Dr. G. F. Giljam became Minister of Education.

Area and Population.—The area of Sweden is 170,979 square miles. The population was computed to be 4,806,865 on Jan. 1, 1893, of whom 2,327,883 were of the male and 2,478,982 of the female sex. The number of marriages in 1891 was 27,940; of births, 139,072; of deaths, 84,159; excess of births, 54,913. The emigration was 42,776 and the immigration 6,114. Stockholm, the capital, had 252,574 inhabitants in 1892 and Göteborg 107,965.

Finances.—The budget for 1894 estimates the ordinary revenue at 22,183,000 kronor (1 krona = 27½ cents). The extraordinary revenue is estimated at 75,200,000 kronor, of which 37,500,000 kronor are derived from customs, 8,100,000 kronor from posts, 13,700,000 kronor from impost on spirits, 3,500,000 kronor from stamps, 2,600,000 kronor from the impost on beets, 9,300,000 kronor from the income tax, and 500,000 kronor from various sources. The total expenditures are estimated at 97,283,000 kronor, of which 1,820,000 kronor are for the civil list, 3,954,000 kronor for justice, 611,250 kronor for foreign affairs, 26,776,686 kronor for the army, 9,503,400 kronor for the navy, 6,937,000 kronor for the interior, 17,631,400 kronor for finances, 14,225,000 kronor for public worship and instruction, 4,639,764 kronor for pensions, 10,933,600 kronor for the public debt, and 749,900 kronor for various other expenses. The public debt on Jan. 1, 1893, was 273,905,763 kronor.

Commerce.—The total value of imports for 1891 was 369,698,000 kronor and of exports 323,498,000 kronor. Of the imports, the principal articles were: Coal, 30,958,000 kronor; rye and wheat, 28,753,000 kronor; coffee, 26,936,000 kronor; woolen goods, 23,936,000 kronor; machinery, 14,190,000 kronor; cotton, 13,429,000 kronor; cotton goods, 10,176,000 kronor. The principal articles of export were: Timber, 111,376,000 kronor; butter, 32,505,000 kronor; iron, 31,915,000 kronor; paper, 22,913,000 kronor; oats, 19,781,000 kronor; fish, 17,116,000 kronor; matches, 9,423,000 kronor; wood pulp, 8,941,000

kronor; animals, 6,715,000 kronor; iron manufactures, 4,319,000 kronor; cotton goods, 3,826,000 kronor; machines, 3,237,000 kronor. Of the imports, 119,836,000 kronor were from Germany, 98,655,000 kronor from Great Britain, 44,620,000 kronor from Denmark, 33,565,000 kronor from Norway, 27,816,000 kronor from Russia and Finland, and 12,935,000 kronor from the United States. Of the exports, 146,885,000 kronor went to Great Britain, 87,876,000 kronor to Germany, 37,391,000 kronor to Denmark, 34,404,000 kronor to France, and under 20,000,000 kronor each to Norway, Holland, Russia, and Belgium. The exports to the United States were 664,000 kronor in value.

Navigation.—The number of vessels entered in 1891 was 31,247, of 5,622,000 tons, of which 11,201, of 2,479 tons, were with cargoes. The number cleared was 29,694, of 5,663,000 tons; 21,385 of them, of 4,327 tons, with cargoes. Of the vessels entered, 14,950 were Swedish, 2,431 Norwegian, and 13,866 foreign. The number of steamers entered was 13,239, of 4,043,000 tons. The mercantile shipping on the registers in 1892 comprised 2,979 sailing vessels, of 377,667 tons, and 1,181 steamers, of 152,493 tons.

Communications.—The railroads in 1893 had a total length of 5,285 miles, of which 1,760 miles belonged to the state and 3,525 miles to companies.

The post-office in 1891 forwarded 47,817,000 domestic and 12,574,000 international letters, 5,359,000 domestic and 816,000 international postal cards, and 52,417,000 domestic and 6,172,000 international circulars, journals, etc. The receipts were 10,797,723 francs; expenses, 10,351,818 francs.

The telegraph lines in 1892 had a length of 7,970 miles, of which 5,440 miles belonged to the Government. The total length of wire was 23,655 miles. The number of paid messages sent in 1892 was 1,156,746 in the interior, 678,231 abroad, and 190,492 in transit. The receipts were 2,021,687 francs; expenses, 881,825 francs.

The Army and Navy.—The law of Dec. 2, 1892, makes every Swede liable to military service from his twenty-first to his fortieth year. Recruits are instructed ninety days altogether, all in the first year for the cavalry and sixty-eight days in the first and twenty-two in the second year for the other arms. The privileged position of the inhabitants of Gottland has been abolished. The effective strength of the active army in 1893 was 38,802 men, including 1,953 officers. The war effective is 272,553 men, not including 150,000 in the Landsturm.

The war fleet in 1893 comprised 3 armor-clad turret ships, 4 ironclad monitors, 10 armored gunboats, 1 frigate, 3 corvettes, 9 first-class and 5 second-class gunboats, 1 torpedo catcher, 4 first-class, 9 second-class, and 7 third-class torpedo boats, 2 school ships, and 2 transports, having a total armament of 97 great and 196 small guns.

Politics.—The advocates of universal suffrage arranged for the election of a convention by popular vote which was called the Folkriksdag, or People's Diet, which met in March at the same time as the regular Diet. The Conservatives took no part in the movement, but the Socialists and the Liberals awakened a general

interest among the working people and the agriculturists, and brought out their full vote. Under the Swedish Constitution no one has a vote who does not own land of the assessed value of 1,000 kronor, or has not farmed for five years land valued at 6,000 kronor, or does not pay a tax on an income of 800 kronor. This restricts the suffrage to 6 per cent. of the population. The popular convention addressed an appeal to the legal Riksdag to consider an amendment for the extension of the suffrage, but the latter, by a vote of 118 to 94, refused to allow the subject to be discussed.

The Riksdag has authorized the reorganization of the army, which requires large expenditures and new taxes. The Government proposes also to build 15 new cruisers, 50 torpedo boats, and 6 avisos. The friends of the Government, to set a patriotic example and encourage the people to make the necessary sacrifices, instituted a national week of voluntary abstinence, the savings from which were contributed to the Government for military purposes.

The result of the general elections, which ended in September, was to strengthen the hands of the Moderate Free Traders and arrest the Protectionist movement. The new Chamber is composed of 85 old Conservative Protectionists, 40 Moderate Free Traders, and 103 Free-Trade Radicals, who have declared for a wide extension of the franchise and ultimate universal suffrage and for the legislative regulation of the hours of labor.

Norway.—The representative assembly is the Storthing, elected for three years by universal suffrage in two degrees. One fourth of the members are separated to form the Lagthing which acts as an upper chamber, while the other three fourths constitute the Odelsting, where all legislation is initiated. Bills rejected by the Lagthing may be made law by a two-third vote of the whole Storthing.

The ministry, at the beginning of 1893, was composed of the following members: Minister of State, J. W. C. Steen; Minister of Finance and Customs, J. W. C. Steen; Minister of Public Works, H. T. Nysom; Minister of Education and Ecclesiastical Affairs, C. C. Berner; Minister of the Interior, Wollert Konow; Minister of Justice, O. A. Qvam; Minister of National Defense, Lieut.-Col. P. T. Holst; Minister of State at Stockholm, O. A. Blehr.

Area and Population.—The area of Norway is 124,495 square miles. The population, as ascertained by the census of Jan. 1, 1891, was 1,988,674, of whom 951,290 were males and 1,037,384 were females. The urban population was 463,631, the rural population 1,525,043. The number of marriages in 1891 was 13,179; of births, 61,721; of deaths, 84,856; excess of births, 26,865. The emigration in 1892 was 17,049. Christiania, the capital, had 148,213 inhabitants present on Jan. 1, 1891.

Finances.—The receipts of the treasury for the financial year 1891-'92 were 50,242,600 kronor, whereof 22,017,300 kronor were derived from customs, 3,597,600 kronor from spirit duties, 2,250,500 kronor from a malt duty, 7,531,900 kronor from railroads, 3,036,900 kronor from posts, 1,232,400 kronor from telegraphs, 1,411,600 kronor from state domains, forests, and

mines, 1,635,300 kroner from invested funds, and the rest from law courts, the university and schools, prisons, hospitals, and asylums, succession duties, a duty on playing cards, etc. The ordinary expenditures were 49,688,500 kroner, of which the principal items were 9,674,700 kroner for operation and maintenance of railroads, bridges, canals, and harbors, 8,882,400 kroner for the debt, pensions, silver mines, and collection of customs, 8,192,400 kroner for the army, 7,101,300 kroner for the post-office, telegraphs, agriculture, fisheries, forests, etc., 4,915,200 kroner for education and worship, 4,955,500 kroner for courts, police, prisons, and sanitary service, and 3,264,100 kroner for the marine.

The public debt on June 30, 1892, amounted to 125,541,200 kroner, and the reproductive capital of the state to 187,468,600 kroner, exclusive of public lands, forests, and mines.

Commerce.—The merchandise imports in 1892 amounted to 200,000,000 kroner and the exports to 126,400,000 kroner. The principal imports were: Cereals for 37,200,000 kroner, tissues for 27,500,000 kroner, colonial wares for 23,200,000 kroner, animals and animal food products for 18,500,000 kroner, coal for 12,400,000 kroner, and metal wares for 10,800,000 kroner. The principal exports were animals and animal food products for 46,000,000 kroner, timber for 27,900,000 kroner, and wood manufactures for 15,000,000 kroner. Over one quarter of the imports came from Germany, something less than one quarter from England, and a little more than one eighth from Sweden. Of the exports, 43,642,000 kroner went to England, 19,709,000 kroner to Sweden, 15,690,000 kroner to Germany, and 12,642,000 kroner to Spain. The imports from the United States were valued at 9,472,000 kroner, and the exports to the United States at 1,842,000 kroner.

Navigation.—There were 12,362 vessels, of 2,921,807 tons, entered, and 12,002, of 2,853,366 tons, cleared in 1891. Of the arrivals, 6,860, of 1,979,489 tons, and of the departures, 6,542, of 1,922,441 tons, were Norwegian vessels. Of the total arrivals, 6,212, of 1,831,931 tons, brought cargoes, and 6,150, of 1,089,876 tons, came in ballast, and of the departures, 10,644, of 2,339,036 tons, carried cargoes, and 1,358, of 514,360 tons, sailed in ballast.

The merchant navy on Jan. 1, 1892, numbered 6,798 sailing vessels, of 1,500,069 tons, and 735 steamers, of 238,511 tons.

Communications.—The railroads in 1892 had a length of 970 miles. The postal traffic for 1892 was 23,449,000 domestic and 8,409,962 foreign letters and postals, and 26,710,600 domestic and 3,917,600 foreign printed inclosures. The postal receipts were 3,130,493 kroner and the expenses 3,111,614 kroner. The telegraphs of the state had a total length of 4,915 miles, with 9,920 miles of wire. The number of internal dispatches was 1,139,527; of international dispatches, 568,700. The receipts were 1,314,591 kroner and the working expenses 1,399,267 kroner.

The Army and Navy.—Military service is obligatory from the age of twenty-three for five years in the active army, but the recruits are only required to remain with the colors from forty-two days in the infantry and fifty in the cavalry and field artillery in the first year and

shorter periods in the succeeding years. The effective strength of the active army is about 1,700 officers and instructors and 18,000 men, which can be supplemented by an equal number of the Landwehr in time of war.

The fleet consists of 4 ironclad monitors, 2 corvettes, 3 first-class, 12 second-class, and 16 third-class gunboats, and 9 first-class and 4 second-class torpedo boats, mounting altogether 75 large and 92 small cannon.

Conflict with Sweden.—The political struggle between the Norwegian democracy and the Swedish Government, which the Swedes treat as a battle for the preservation of the Union, has been lately restricted to the question of a separate consular service. The Norwegians argue that consuls appointed and instructed by the Swedish Government do not adequately protect their maritime interests, exceeding fourfold those of Sweden. The Radicals of Norway also have demanded the creation of an independent Ministry of Foreign Affairs, alleging that it is necessary to preserve them from any wars or alliances in which Sweden may involve herself. Under the act of union the Norwegian militia is not bound to serve outside of Norwegian territory. When the dispute over foreign affairs first arose, in 1837, the Swedish Government offered to make the Ministry of Foreign Affairs responsible to both Legislatures, with a chief who might be either a Swede or a Norwegian, provided that the Norwegian troops should share the duty of the common defense of both kingdoms. This proposition was rejected, and three commissions for the revision of the Constitution have since come to naught. Sverdrup and the Radicals asserted that the exclusive Swedish control of foreign affairs is contrary to the spirit of the act of union, which they regard as a simple dynastic union and defensive alliance. The Swedish Government offered to compromise by establishing a common Ministry of Foreign Affairs, whose head might be indifferently a Swede or a Norwegian. This proposition was rejected on Jan. 14, 1893, as illusory and prejudicial to Norway's elementary right to control her foreign relations.

When the Storting met the Radicals offered a resolution asserting the right of Norway to independent action in all matters not specifically reserved in the act of union, and calling upon the Norwegian Government to proceed in accordance with the vote of June 10, 1892, to establish a separate consular service. This was passed on March 17 by 64 votes against 50 given in favor of the proposition of the Conservatives and Moderates to continue negotiations with the Swedish Government for a compromise. Premier Steen said that legal means would be found to dissolve the Union if Norway could not otherwise come by her rights, and he accused the King of having violated the law in not sanctioning a Norwegian consular service. The King went to Christiania, and, in compliance with the resolution of the Swedish Diet, again refused to sanction Norwegian consulates. The Steen Cabinet then resigned, April 22, and on April 24 the Storting suspended its sittings, precisely as was done in 1892. Stang, the Conservative leader, finally consented to form a Cabinet, which was constituted on May 1 as follows: Minister of State, Emil Stang; Minister of Finance, O. A.

Furu; Minister of Public Works, P. Nilson; Minister of Worship and Public Instruction, Prof. A. C. Bang; Minister of the Interior, J. H. P. Thorne; Minister of Justice, Prof. G. F. Hagerup; Minister of National Defense, Capt. C. W. E. B. Olsson; Minister of State in Stockholm, G. W. W. Gram. The Storting passed a vote of want of confidence in the new ministers by 63 votes against 51. The King had first asked the President of the Storting and other members of the majority to form a ministry, and only appealed to Stang when they refused. He was forbidden by the Constitution to dissolve the Storting, which had nearly two years still to last. Premier Stang declared that he and his colleagues had accepted office to extricate the country from the predicament of having no Government, and not to influence the final decision of the consular question. The Storting, which voted an annual allowance of 6,000 kronor to Steen in recognition of his patriotic services, reduced the civil list, passed a bill to remove the insignia of the Union from the Norwegian national flag, resolved to withhold supplies for the joint consular service from Jan. 1, 1895, and stopped the salaries of the ministers.

SWITZERLAND, a federal republic in central Europe. The Federal Assembly is composed of the Nationalrath, consisting of 147 members elected for three years by direct popular suffrage, and the Ständerath, to which each of the 22 cantons sends 2 delegates. The executive power of the federation is vested in the Federal Council, consisting of 7 members elected by the Federal Assembly for three years. The Federal Council in 1893 was composed of the following members: President and Chief of the Interior Department, Dr. K. Schenk, of Bern; Vice-President and Chief of the Military Department, E. Frey, of Basel; Foreign Affairs Department, A. Luchenal, of Geneva; Department of Justice and Police, vacant after the death of L. Ruchonnet, of Vaud; Department of Finance and Customs, W. Hauser, of Zurich; Department of Industry and Agriculture, A. Deucher, of Thurgau; Department of Posts and Railroads, J. Zemp, of Luzern; Chancellor of the Confederation, G. Ringier. Col. Emil Frey was elected on Dec. 14 President of the Confederation for 1894.

Area and Population.—The area of Switzerland is 15,976 square miles. The population at the census of 1888 was 2,917,754, divided into 1,417,574 males and 1,500,180 females. There were 1,716,548 Protestants, 1,183,828 Catholics, 8,069 Israelites, and 9,809 of other creeds. The German-speaking population numbered 2,083,097, while 634,613 spoke French, 155,180 Italian, 38,357 Romance, and 6,557 other tongues. The number of marriages in 1891 was 21,264; of births, 86,721; of deaths, 64,308; excess of births, 22,413. The number of emigrants in 1892 was 7,835, of whom 7,842 emigrated to the United States. The population of Zurich in 1893 was 103,271; of Geneva, 78,777; of Basel, 75,114; of Bern, the seat of government, 47,620.

Finances.—The receipts of the Federal Government in 1892 amounted to 92,564,995 francs, of which 36,032,738 francs were from customs, 26,231,725 francs from the post-office, 20,919,473 francs from the arsenals, powder

works, etc., 4,628,146 francs from telegraphs and telephones, 2,093,327 francs from the mint, 1,066,152 francs from capital invested, and the rest from the various departments. The total expenditure was 102,850,802 francs, of which 52,623,591 francs were for military purposes, including the manufacture of arms, powder, etc., 29,316,697 francs for the postal and telegraph service, 6,150,566 francs for financial and customs administration, 6,186,857 francs for buildings, and 3,167,719 francs for the Federal debt. The debts amounted to 64,188,423 francs, and the assets of the Government to 115,467,735 francs.

Commerce.—The value of the special imports of merchandise in 1892 was 869,987,000 francs, and of the domestic exports 657,649,000 francs. The imports of precious metals were 43,176,000 francs, and the exports 30,371,000 francs. The imports of silk amounted to 184,800,000 francs; of grain and flour, 105,800,000 francs; of woolen thread and cloth, 44,600,000 francs; of chemicals, 38,300,000 francs; of animals, 37,900,000 francs; of wine, 34,900,000 francs; of coal, 33,200,000 francs; of cotton, 30,200,000 francs. The exports of silk goods amounted to 185,200,000 francs; of cotton goods, 112,900,000 francs; of watches, 88,800,000 francs; of raw silk, 40,100,000 francs; of cheese, 38,500,000 francs; of spun silk, 34,600,000 francs; of machines and carriages, 21,700,000 francs; of chemical products, 18,100,000 francs.

Communications.—The railroads in 1892 had a length of 2,105 miles. The post-office in 1892 forwarded 77,182,000 domestic and 13,595,000 international letters, not including those received, 14,577,000 domestic and 4,297,000 international postals, and 22,573,000 domestic and 6,827,000 international circulars. The Government telegraphs in 1892 had a total length of 4,545 miles, with 12,060 miles of wire. The number of dispatches was 3,766,354, of which 1,236,992 were foreign.

The Army.—The effective of the army at the beginning of 1893 was 131,424 men in the Auszug and 81,485 in the Landwehr. The troops are organized in 4 army corps attached to as many districts.

Politics and Legislation.—The referendum has been recently extended so as to give the people the power of initiating as well as vetoing legislation. This right was used in 1893 to enact a measure that dismayed and disgusted the Radicals, who were the authors of the change in the Federal Constitution. The Society for the Prevention of Cruelty to Animals started an agitation in favor of prohibiting the Jewish manner of slaughtering animals for food by bleeding them before they are dead, and the diets of Bern, Aargau, and other cantons passed laws forbidding this form of slaughter. The Jews appealed to the Federal Government to protect their religious liberties. The cantonal governments were enjoined to expunge the laws. They heeded not the demand, and meanwhile the society called for a general referendum, and the people, whose race prejudices had been kindled by the anti-Semitic movement, caught up the cry, petitioned for a referendum with 83,159 signatures, and prohibited by a popular vote, taken on Aug. 20, the observance of the Talmudic rules for butchering. Taught by this

curious exhibition of the popular will, the Conservatives and Clericals, in the hope of checking the tide of Radical legislation, are inclined to favor one of the academic tenets of the Radical programme which the Democrats are not ready to put into practice in the present stage of political enlightenment. This is the making of the referendum obligatory, so that no decision of the Federal Assembly shall become law until it has been confirmed by a popular vote.

While the International Congress of Social Democrats was discussing at Zurich, in August, measures for the international establishment of the eight-hour day, political tactics of the Social Democracy, universal peace, the attitude to be taken by Social Democrats in case of war, the protection of working women, the national and international extension of labor unions, and its other *agenda*, a petition was circulated calling for the insertion in the Federal Constitution of an article recognizing the right to labor, which obtained 52,887 signatures. The proposed amendment is expected to secure work at sufficient wages to every Swiss citizen by Federal, cantonal, and communal legislation directed toward the shortening of hours of labor, the establishment of public and gratuitous intelligence offices, the protection of employees against undeserved dismissal, adequate support or assistance from the public funds for all who are wholly or partly thrown out of work through no fault of their own, the securing of laborers in the right to form or to join unions for the protection of their interests, and the establishment of legal rights for laborers in respect to their work and their employers. The Socialists set forth as their ultimate object the nationalization of the means of production and exchange, by the abolition of individual capitalists and the substitution of state and municipal enterprise in their stead.

An international congress of anarchists was held in Zurich in the same month as the Socialist congress, from which the anarchists were excluded. No binding platform was adopted, for that would be contrary to the anarchistic prin-

ciple, but a series of resolutions were approved, the first of which declared that revolutionary Socialists and communistic anarchists could work harmoniously together so long as they agreed in holding that all slavery and all misery were the result of the oppression and plundering of the great mass by a minority of the people, and that the oppressed must strive for the annihilation of the existing capitalistic society by all means in their power, legal or illegal, pacific or violent. The parliamentary system was denounced as an institution of the *bourgeoisie*, which only serves to codify and legalize the ideas of oppression.

In the elections for the Nationalrath, held Oct. 29, the Socialists were defeated wherever they set up an independent ticket or where they combined with the Conservatives, and were only successful where they allied themselves with the Democrats.

In December a drastic law was passed for the repression of anarchistic outrages, which provides that persons who incite others, through the press or otherwise, to commit outrages by the use of explosives or otherwise, are liable to penal servitude; persons found in possession of chemicals to be used in manufacturing explosives for criminal purposes, or aiding or abetting such manufacture, are liable to imprisonment for at least fifteen years; persons causing explosions render themselves liable to imprisonment at hard labor, ranging from ten years to a life sentence; and persons knowingly spreading incitements to commit outrages are punishable by a fine of 2,000 francs, or imprisonment, or both.

The Federal Council has proposed the introduction of a tobacco monopoly, to provide means for a scheme of Government insurance against accidents and illness. The alcohol monopoly, which insures the purity of the spirits sold in the retail trade, without limiting or regulating their sale, has had the effect of diminishing the total consumption. One tenth of the profits of the monopoly, which were about \$110,000 in 1891, must be spent in combating the causes and effects of alcoholism.

T

TELEPATHY. It requires no long search to find a person who at some time has had an impression that an absent friend was in need of his presence, and has found that at the time this impression was perceived the absent one was passing through some crisis of danger or the supreme crisis of life—dissolution. The impression has varied, in different instances, from an indefinite sense of anxiety concerning the absent one to an apparition of the person, which seemed to speak. These experiences have been habitually ignored by psychologists, who have deemed the evidence concerning them either honest delusion or intentional deception. But in 1882 the Society for Psychical Research was organized in England, for the purpose of investigating this and other neglected spots in the field of psychology. The name *telepathy* was devised by the society to denote "the ability of one mind to impress or be impressed by another mind other-

wise than through the recognized channels of sense." Hence, besides the spontaneous transferences of thought alluded to above, the term includes those made designedly in "mind reading" or the parlor amusement known as the "willing game." The giver of the impression is called the "agent," the receiver of it the "percipient."

Under the title "Phantasms of the Living" two bulky volumes have been published by Messrs. Gurney, Myers, and Podmore, three members of the Society for Psychical Research, with the sanction of the council of the society. These volumes contain a large number of cases of apparently telepathic action, with comments, and much similar material is appearing in the "Proceedings" of the society. Among the experiences thus recorded are the following:

The Rev. P. H. Newnham, an English clergyman, in March, 1854, was a student keeping his

last term at the University of Oxford. He was subject to neuralgic headaches, and one evening, when he had an unusually violent one, he went into his bedroom about 9 P. M. and flung himself, without undressing, on the bed, and soon fell asleep. "I then had," he writes, "a singularly clear and vivid dream, all the incidents of which are still as clear to my memory as ever. I dreamed that I was stopping with the family of the lady who subsequently became my wife. All the younger ones had gone to bed, and I stopped chatting to the father and mother, standing up by the fireplace. Presently I bade them good-night, took my candle, and went off to bed. On arriving in the hall, I perceived that my *fiancée* had been detained downstairs, and was only then near the top of the staircase. I rushed upstairs, overtook her on the top step, and passed my two arms round her waist, under her arms, from behind. Although I was carrying my candle in my left hand when I ran upstairs, this did not, in my dream, interfere with this gesture. On this I woke, and a clock in the house struck ten almost immediately afterward. So strong was the impression of the dream that I wrote a detailed account of it next morning to my *fiancée*. Crossing my letter, not in answer to it, I received a letter from the lady in question: 'Were you thinking about me very specially last night just about ten o'clock? For, as I was going upstairs to bed, I distinctly heard your footsteps on the stairs and felt you put your arms round my waist.' The letters in question are now destroyed, but we verified the statement made therein some years later, when we read over our old letters previous to their destruction." Mrs. Newnham has also given, in writing, under the date of June 9, 1884, her recollection of the occurrence, which perfectly corroborates that of her husband. This is the only experience of the sort she had ever had ("Phantasms of the Living," i, pp. 225-227).

Here we observe that the mind of Mr. Newnham was occupied with his *fiancée*, and traced out a sequence of actions concerning her. At the same hour her mind pictured him performing these very actions. In some way the thoughts passing through his mind were caused to pass through her mind. They were not communicated by voice, letter, or telegraph, hence the inference that his mind must have been able to impress hers directly.

The foregoing case concerns a pleasurable incident, and in this respect belongs to a small class. Far more common are such as follow, which relate to injury and death. Of the 668 cases enumerated in "Phantasms of the Living," 399 occur upon the death of the agent.

Two friends, a young lady and a gentleman, had made the common agreement that whichever died first would try to visit the other. Years passed; the gentleman, Capt. W., was in New Zealand, the lady, Miss R., was in England. One night, Miss R. woke with a feeling that some one was in her room. She had a bright light burning, and behind the table on which it stood she saw a misty image of a man's head and shoulders gradually form, and recognized it as the image of her friend. She got up and made a note of the date, thinking that Capt. W. must be dead. His relatives heard no news from him for an unusually long time; then a brief note came from

him which read: "Have had a severe fall off the coach; can't write; head all wrong still." On investigation, Miss R. found that it was during the time when Capt. W. was insensible from his fall that she saw him. The injury did not cause death. ("Phantasms of the Living," i, 527-528.)

The impression received by Miss R. was a visual one; those in the two that follow are auditory. In some cases both the image of the agent and the sound of his voice are perceived.

An English lady, Mrs. Evens, had been at a school in France when a girl, and formed a deep attachment for one of the principals, Mme. H. Mrs. Evens has narrated that the year after she left France, in September, 1858, she awoke one night as if she had been called. She saw nothing, but heard distinctly in the well-known and beloved voice of her friend the words, "Adieu, ma chérie" (Mme. H.'s name for her). A week afterward she heard that Mme. H. had died suddenly on the night of her experience. Many years afterward Mrs. Evens learned that the French lady was supposed to have committed suicide, and she fully believes that her friend desired to take leave of her, and, being a woman of strong will, had succeeded in transmitting her adieu. ("Phantasms of the Living," ii, pp. 690-692.)

But now admitting that persons seem to see images and hear voices, as in the foregoing narratives, what are these phenomena, it has been asked, but hallucinations such as every alienist is familiar with as the product of a morbidly stimulated brain? To this query the Society for Psychical Research replies, (1st) that the percipients in a large number of its cases never had but one such experience; (2d) that telepathic hallucinations are not merely of some human form like most of the morbid sort, but represent a person whom the percipient recognizes; (3d) that telepathic hallucinations are *veridical*—i. e., at the time when the impression is perceived the mind of the agent is being violently exercised by the approach of death or in some other way; (4th) that while one person affected with nervous disease might have a given hallucination, the same thing would not be likely to appear to another, whereas telepathic hallucinations have been perceived by more than one percipient at the same moment. The following will serve as a sample of these "collective" cases. The impression received was auditory, but other cases are on record in which it was visual: In 1854 there was a family named Focke, living in Düsseldorf, and the eldest daughter, Anna, had sailed for Batavia, island of Java, as companion in the family of a Dutch Government official. One evening soon afterward, when Mrs. Focke, with the rest of her family, was at tea, they all heard a loud cry of "Mother!" outside the window. They all recognized at once the voice of Anna, and rushed to the window, but saw nothing. Scarcely had they taken their seats again when a most agonizing shriek was heard, and twice "Mother! Mother!" was called in the same voice. In a short time news came that on that very evening the vessel on which Miss Focke had sailed was lost with all on board.

There are several reasons why the Society for Psychical Research regards as a phantasm of

the living rather than an apparition of the dead the impression received from an agent at about the time of his dissolution. One is that precisely similar impressions are transferred from persons who do not die at the time. It has been found that telepathic action of the latter sort can be produced experimentally, and under the auspices of the society a large number of such experiments have been made. The tests consisted in the percipient naming articles or playing cards thought of by the agent, reproducing drawings, answering questions by the planchette, etc. The tests have been far from uniformly successful, but the proportion of successes is regarded as encouraging. Spiritualists claim that even in thought transference between two living persons the thought is conveyed by the spirit of a deceased person.

An important part of the evidence for the reality of thought transference is the fact that the experiences recorded have occurred at the time when the mind of the agent was violently affected in one way or another. The attempt has been made to explain this away as mere coincidence, but the authors of "Phantasms of the Living" have presented calculations to show that the probability of such coincidences occurring is almost infinitely small. It is evident that if the percipient were in the habit of seeing a vision of some absent friend, say, once a week, the fact that the agent died at the time when one of them was seen might properly be taken as a coincidence of no moment, but where, as has often occurred, such a phantasm was seen only once in the whole life of the percipient, it can hardly be explained away in this manner. Why we are not all informed by telepathy of the death of friends can not be known until more is learned of the causes that make one mind different from another. But there is no evidence for such agency on the part of the deceased that can be admitted in a scientific inquiry, such as the society is conducting. Great care has been taken by the society to verify every instance of telepathy that it has published. Independent written accounts have been obtained from every accessible person who knew the facts in each case, any letters, diaries, or other documentary evidence obtainable have been examined by a representative of the society, and in death cases the date of the death has been ascertained from a public record. The most valuable sort of evidence—a written record of the percipient's experience made before he could receive news from the agent—has been seldom procurable. Heretofore few persons have known the desirability of such records, but as the work of the society becomes more widely known it is expected that cases with incontestable documentary evidence will be forthcoming. Until these are obtained, the few conclusions that the investigators in this field have allowed themselves to make are regarded as merely tentative.

TENNESSEE, a Southern State, admitted to the Union June 1, 1796. The population, according to each decennial census since its admission, was 105,602 in 1800; 261,727 in 1810; 422,771 in 1820; 681,904 in 1830; 829,210 in 1840; 1,002,717 in 1850; 1,109,801 in 1860; 1,258,520 in 1870; 1,542,359 in 1880; and 1,767,518 in 1890. Capital, Nashville.

Government.—The following were the State officers during the year: Governor, Peter Turney; Secretary of State, William S. Morgan; Treasurer, Edward B. Craig; Comptroller, James A. Harris; Commissioner of Agriculture, Statistics, and Mines, T. F. P. Allison; Superintendent of Public Instruction, Frank M. Smith; Adjutant-General, John A. Fite; Attorney-General, G. W. Pickle—all Democrats. Chief Justice of the Supreme Court, Benjamin J. Lea; Associate Justices, W. C. Caldwell, D. L. Snodgrass, John S. Wilkes, W. K. McAlister. After Chief-Justice Turney resigned, to take the office of Governor, Justice Lurton was chosen to his place, and the vacancy was filled by the appointment of John S. Wilkes. When Judge H. E. Jackson was appointed to the United States Supreme Court, Judge Lurton was appointed to take his place as judge of the United States circuit court. Judge Lea was chosen Chief Justice, and W. K. McAlister was appointed to the vacancy.

Finances.—Some excitement was caused after the failure of the Commercial National Bank by uncertainty regarding State bonds to a large amount, which were rumored to have been under control of the bank, and believed to have been used to further schemes of private speculation. In October, 1892, 4-per-cent. bonds amounting, in round numbers, to \$1,500,000, were prepared, with which to take up the outstanding 5s, 5½s, and 6s.

Subsequently the new funding board decided to cancel \$1,000,000 of these bonds which had not been sold, stamping on each the words: "Canceled by order of the Funding Board April 18, 1893, the act authorizing the issuance of this bond having been repealed before its negotiation." The act of repeal, passed in April, empowered the Funding Board to issue two series of bonds; one, \$800,000 in amount, is the Penitentiary series, and the other, more than \$1,000,000, is the redemption series, and is to redeem the funded 5-, 5½-, and 6-per-cent. bonds. In May the Supreme Court rendered a decision as to the validity of the new bonds, declaring them to be constitutional.

The mortgage indebtedness on property in the State appears, by a United States census bulletin, to average \$23 to the head of population, and its ratio to the assessed value of real estate is 8·67. The amount of deposits in the savings banks at the close of 1892 was \$1,292,913.

Banks.—In the period from Jan. 1 to Sept. 1, 1892, Tennessee banks failed. Among these was the Commercial National Bank of Nashville. Connected with it was the failure of the cotton firm of Dobbins & Dazey. An investigation by Bank-Commissioner J. M. McKnight resulted in the arrest and indictment of G. F. Dazey, of the firm, and Frank Porterfield, cashier of the bank, on a charge of conspiring to embezzle. The Mechanics' Savings Bank and Trust Company of Nashville made an assignment April 17, the assets being placed at about \$200,000 nominal, and the liabilities at \$150,000. The cashier, who confessed himself a defaulter to the extent of \$40,000, died within a few days.

Charities.—The Eastern Hospital for the Insane had 290 patients in February, and the Western Hospital 319. The Central Hospital for the Insane has been partly rebuilt since the

fire of 1891. The Industrial School, the schools for the blind, deaf and dumb, and the Confederate Soldiers' Home were all reported in good condition by an investigating committee of the Legislature.

Labor Troubles.—It was hoped that the action of the courts in Anderson County on the disturbances of 1892 in eastern Tennessee would prevent any further demonstrations on the part of the miners. But lawlessness broke out at Tracy City in April. Rumors were current that a general strike was organizing in the coal region. Fort Anderson was strengthened by the erection of heavy redoubts for artillery. The timber, which afforded such safe cover for sharpshooters, was cut away from the hillsides, making it impossible to come within range of the fortifications unobserved.

Fighting began in the evening of April 19, when a body of miners from 75 to 100 strong went to the stockade and sent 8 of their number to the gate with a demand that the convicts be released. On the refusal of the deputy, the leader said that he and his companions represented 700 miners, and that they had the dynamite and the arms to release the convicts by force. Then he held up in his hand a dynamite cartridge, such as is used in blasting away slate in the mines, and was on the eve of making a threatening movement, when the deputy warden and the sheriff seized him, and dragging him inside the gate, closed it. As soon as their companion was seized, and before the guards could get their hands on them, the other two walked rapidly away, brandishing their arms as they went. The sheriff ordered the guards to fire upon them, but for some reason this was not done. The captured miner had hardly been taken inside the little room near the gate when the guards heard the patter of shots from a score of weapons. By a preconcerted signal they came from every side of the stockade. The miners had closed in on the stockade, and were actually thrusting the muzzles of their guns through the portholes. In an instant the guards were at their posts, and then the salute from the outside was answered by a volley from within. The miners had the advantage, as the lights on the inside enabled them to see every movement of the beleaguered guards. But the latter took to the upper portholes and then the battle raged furiously for a few minutes. Fully 500 shots were fired. Deputy Shriver had climbed into the second story of the stockade, where he could look down on the besiegers. He had hardly reached the room before a miner saw him in the lamplight and aimed at him. Shriver saw him, and they fired almost simultaneously. Shriver was shot twice in the right side of the face, while his adversary fell dead in his tracks. In the meantime the captured leader had been released by Sheriff Sanders and the guards upon a promise that he would go out and stop the firing. This he did not do, and after his release Guard S. A. Walden received a full charge of 7 shots from a gun thrust through one of the portholes. Five miners were wounded in the fight. The besiegers broke for a hill overlooking the stockade, and fired for some time longer, but everything was quiet by morning. The State troops, under the Adjutant-General, were sent on the

next day. A mass meeting of citizens was held soon afterward, at which speeches were made condemning the action of the rioters, but deprecating the infliction of any punishment. Resolutions were offered, one of which asked mercy for the rioters and expressed sympathy for them. The Adjutant-General, who had come to the meeting by invitation, told the citizens they were making a great mistake. He said the Governor was not only going to make every effort to capture every one of the malefactors, but that he was going to punish them. He advised them to withdraw that clause, as it would prejudice their case, and said that he himself would put down lawlessness in the State at any cost, and that they must obey the law or take the consequences. The clause was then withdrawn.

Later in the year trouble was made by rioters at Coal Creek, and the militia was sent there. The leader was tried and sentenced to five years' imprisonment for rioting and two years for interfering with convicts.

Sunday Laws.—A bill was introduced into the Legislature, but not passed, to relieve the Seventh-Day Adventists from prosecution for working on Sunday, after having kept their Sabbath the day before. The prosecutions were renewed in the cases of three men, one fifty-five and another sixty-two years of age, who refused to pay their fine, declaring that it was unjust and that they were liable to be arrested again as soon as they were released. They were consequently kept at work with criminals at shoveling on the highway until they had worked out their fine.

Burial Place of President Polk.—The remains of President James K. Polk and his wife were removed, Sept. 19, from the tomb at Polk Place, in Nashville, the family residence, and reinterred in the State Capitol grounds. After the death of Mrs. Polk suit was brought in the Chancery Court, by descendants of President Polk, to set aside the will of the President and divide Polk Place among them. The Chancellor decided the President's will was void, inasmuch as it provided for perpetuity by declaring that the property should forever remain in the possession of the Polk family, passing from time to time to the worthiest bearing the name of Polk.

The Virginia Boundary.—The State of Virginia filed a bill in the Supreme Court of the United States some time since against the State of Tennessee, setting forth that the boundary line agreed upon in 1803 was not the line in the original charter, and that the agreement about the line in 1803 was void, being a compact between two States, which the Constitution forbids without the consent of Congress.

This was met by Tennessee with these arguments: That a mere agreement between two States as to where the line was was not a compact; that if it was a compact, it was good between the States until Congress dissented, and that Virginia was estopped; that if there had been no agreement and no line made by the States but an Indian or a buffalo trail which the two States had treated as the line—merely acquiesced in it for more than eighty years—such acquiescence was binding on both States. In addition to these questions, Virginia presented the bill in a second respect, that the line was ob-

source, and the Court should have the line ascertained and marked. This was met by showing that the marks made in 1803 were still visible, that the line was rerun and remarked in 1856, and that the line was not obscure.

The decision was in favor of Tennessee on all the points. The territory involved in the dispute is about 700 square miles, being from 8 to 6 miles wide and 118 miles long. It contains the towns of Bristol and Cumberland Gap, and it involves a serious question of back taxes. In 1802 John Sevier, Tennessee's first Governor, with gentlemen from Virginia, ran the line which is now finally established as the true line.

Legislative Session.—The Legislature convened Jan. 2, and adjourned April 11. On joint ballot there were 94 Democrats, 32 Republicans, and 6 Independent Democrats or Populists. William C. Dismukes was chosen Speaker of the Senate, and Ralph Davis of the House.

On Feb. 25 a court decision was rendered in Memphis disbaring Speaker Davis from the courts of the State. The charge on which the action was taken was that Mr. Davis had collected \$2,250 from a client for a purpose requiring only \$1,000. On complaint of the client and investigation, the attorney had been disbarred. Meantime he had sued a newspaper in which an account of the transaction was published for \$50,000, and procured an indictment of the editors for criminal libel. It was desired that in view of this action Mr. Davis should resign the speakership of the House. Soon after the House assembled, March 8, Mr. Davis called Mr. Truesdale to the chair and made a statement of his position in the matter. He declined to resign the chair. A resolution was at once adopted asking him to resign, but he still refused, and then, after considerable discussion, a resolution was adopted, by a vote of 73 to 9, expelling him from the chair. Hon. Julius A. Truesdale was then elected, receiving every vote in the House. Later in March a charge was made against the ex-Speaker in the House, that he had caused to be brought in by another member a bill for the passage of which money was to be paid. A committee of investigation was appointed, who reported that the charges had been sustained; that Mr. Davis, while Speaker of the House, advised those interested in the bill to pay contingent fees, and offered to select an attorney to whom money was to be sent for lobbying and for corrupt purposes. After a stormy debate on a motion to decline to receive the report, the motion was withdrawn and the report was received. It was then voted that it be expunged from the journal by 40 to 32, 27 not voting.

The Governor-elect was seriously ill in January and unable to take the journey to Nashville. The Legislature therefore passed a joint resolution that the oath be administered to him at his home, Wolf's Crag, near Winchester; and the Chief Justice inducted him into the office there, Jan. 16, in the presence of the justices of the Supreme Court, committees of the Legislature, State officials, and representatives of the press. Gov. Turney sent his first message to the Legislature Jan. 31. He advised the passage of the "Intermediate Court" bill in order to relieve the Supreme Court and keep up with increasing litigation, calling attention to the fact that while

that court in Tennessee averaged about 1,250 cases a year, the average in the other States was about 400. He recommended that the salary of the supreme judges be raised to at least \$4,000.

Among the other recommendations were: Amendment of the registration law so that there should be but one registration for each year, at which a certificate for each election to occur during the year should be issued to the voter, who will be required to surrender such of the certificates as relates to the election in which he offers his ballot; provision for special elections; and amendments to the road law. In a subsequent message he recommended the calling of a constitutional convention.

William B. Bate was re-elected, Jan. 17, to the United States Senate. A joint resolution was adopted in favor of the appointment of a commission to settle the claim of the Tennessee Coal and Iron Company in case settlement should be made within ninety days; otherwise the pending suits were to be prosecuted to the end. An important change was made in the Penitentiary system. The inadequacy of existing prison accommodations and the recent troubles arising from the convict-lease system made some radical action imperative. A new prison will be built and the lease system abandoned.

The convicts are to be divided into three classes. There shall be but one prisoner confined in a cell, and the men and women are to be kept in different portions of the prison. The commissioners are to make contracts for the building or extension of railroads to the prison to insure the shipment of the products of the mines or prison, but such roads or extensions are to be built without cost to the State. Under the provisions of another section, convicts can work out the costs of their arrest and conviction on a basis of 40 cents a day.

The State is to issue \$600,000 of bonds to provide the funds for carrying out the provisions of the bill.

An act was passed entitled "An Act to authorize and provide for the preparation and issuance to the banks and banking associations of this State circulating notes, to fully protect the same, and to provide for State supervision and examination of all banks accepting the provisions of this act."

A committee was appointed to investigate the Comptroller's and Treasurer's offices.

Much of the time was given to a new revenue bill, which makes some radical changes in the privilege taxes. Following are some of the important changes made by the provisions of the law: A privilege tax of \$50,000 is to be levied on dealers in futures; in cities, towns, and taxing districts of over 5,000, photographers will be each charged \$75 per annum, an increase of \$25; national banks are no longer exempted from the tax on other banking associations; brewers are required to pay \$150 (this tax applies to local agents for breweries selling or delivering beer to the trade); architects and mining engineers must pay \$25; merry-go-rounds are taxed \$10 to \$30; laundries in the large cities, \$100; shippers of mineral waters, \$5; peddlers of patented articles, if on foot, must pay in each county \$15; if with horse or vehicle, each county \$30; if with more than one

horse, for each additional horse in each county, \$12; dealers in sewing machines have their tax raised \$80 in the larger counties, while in counties of 30,000 to 50,000 the price only goes up \$10. In all counties under 30,000 the figures will be \$10; the tax on skating rinks is reduced \$100 in the large towns; the tax on street-car companies is reduced \$5; on turnpikes each toll gate pays \$12, reduced from \$25; express companies must pay \$500 to \$1,000 more; brokers' taxes are lower—\$200 instead of \$300 in places of 8,000 or more; butchers in cities of 20,000 or over pay \$50; 10,000 to 20,000, \$30; 5,000 to 10,000, \$20; 1,000 to 5,000, \$10; wholesale butchers or dealers (cold-storage companies only) \$300, an increase of \$50. In towns of less than 1,000, and also all other butchers, \$5; cemeteries conducted by individuals or companies for profit pay from \$5 to \$25; commercial and mercantile agencies pay \$50 more than before in towns of 20,000 or over, and cotton commission merchants \$15 more; foreign coal oil and illuminating oil companies must pay \$500 per annum in places of 50,000 or over, and proportionate sums in smaller places; dealers in county certificates or warrants or city warrants, not paying taxes as bankers or brokers, pay \$100 a year in places of 50,000 or over; all parties, banking associations, or brokers, or their agents, buying or attempting to buy the fees of any officer or witness accruing in any of the courts of the State, will pay tax as follows: in counties of 50,000 or over, \$400; 40,000 to 50,000, \$300; 20,000 to 40,000, \$200; and less than 20,000, \$25 (heretofore there was no tax on these men); the tax on gas companies in the larger places is cut from \$700 to \$500; each agent of mutual-assessment companies—fire, accident, or life—in each county in which they do business must pay to the county clerk a yearly tax of \$100 (this is a new privilege, and is leveled at mutual-benefit associations); there is no change in the tax on liquor dealers, wholesale or retail, but dealers selling liquors in quantities less than 5 gallons are to be regarded as retailers (heretofore 1 quart has been the limit); each person, corporation, firm, or company engaged in selling pools on horse races must pay \$250 per annum (this is a new privilege); bookmakers on horse races, each agent, firm, person, or corporation, or firms in each county, must pay \$50; real-estate dealers have their tax reduced one half.

Two bills affecting the militia were passed. One appropriates \$45,000 to equip the State Guard, but under ordinary circumstances only \$15,000 of it can be used in one year. It is intended to buy clothing and outfits, so that the Guard may be prepared to take the field on short notice. There are 30 companies in the State, or about 1,500 men. These companies have almost no equipment at present, and every company must be supplied with more or less furnishings. The other is the insurrection bill. It gives the Governor almost unlimited power in times of rebellion or insurrection to call out the military and take such other means as are within reach to quell it, and to use the State's money to this end as far as necessary to serve the welfare of the State.

A resolution was adopted favoring an amendment to the Constitution, and a bill passed pro-

viding that it shall be voted upon at the next regular election for members of the Legislature, in November, 1894. The section of the Constitution proposed to be amended is as follows, the words quoted being the amendments:

ARTICLE XI, SECTION 13.—The General Assembly shall have power to enact laws for the protection and preservation of game and fish within the State; "laws for the construction, maintenance, working, and laying out of public roads, and laws defining and establishing legal fences, or abolishing all fences; also laws regulating elections in this State," and such laws may be enacted for, applied and enforced in particular counties or geographical districts designated by the General Assembly.

A bill was passed depriving State officers of the fees heretofore allowed by law, and fixing their salaries as follow: Governor, \$4,000; Secretary of State, \$3,000; Treasurer and Comptroller, \$3,500 each. The office of private secretary to the Governor was separated from that of Adjutant-General, and a special office of private secretary was created, the bill providing for a salary of \$1,200. The Adjutant-General's salary was placed at \$1,800.

An appropriation of \$12,000 was made for improvements on the Capitol building.

The *per capita* appropriation for patients in the insane hospitals was raised from \$145 to \$155.

Physiology and hygiene are to be studied in the public schools, with special reference to the effect on the human system of alcoholic stimulants and narcotics.

Other acts were these:

Enabling the Commissioner of Agriculture and Statistics to secure statistics from manufacturers and common carriers.

Creating a new chancery division, to be called the twelfth.

Allowing the building of a bridge across the Tennessee at Chattanooga, and authorizing the issuing of \$150,000 of bonds for the purpose by Hamilton County.

Compelling insurance companies to pay the full amount of all policies.

Increasing the sum to be used for expenses of State normal institutes to \$1,500.

Raising the annual appropriation for the State Normal College from \$10,000 to \$15,000.

Appropriating \$7,500 for an industrial building and gymnasium at the Deaf-Mute School in Knoxville.

Raising the appropriation to the School for the Blind from \$37,000 to \$39,000.

Authorizing the creation by counties of the office of commissioner of fish.

Compelling building and loan associations to have annual examinations made by an agent of the State at their own expense.

Allowing Nashville to issue \$150,000 in bonds to build approaches to the new union depot.

Allowing counties to build reformatories.

To prevent blacklisting or publishing of discharged employees.

Charges having been made against Judge Julius J. DuBoe, judge of the criminal court of Shelby County, in a memorial to the House signed by 3,000 citizens, asking that the court of the county be abolished, or some other means taken of deposing Judge DuBoe, the House adopted a resolution of impeachment, by a vote of 84 to 4. There were 12 articles and 36 specific charges. The House appointed a committee to prosecute the case before the Senate, and the Senate met May 10 as a court of impeachment. The hear-

ing of evidence was continued through two weeks, and the arguments occupied a week. The vote was reached June 2. The Senate was unanimously in favor of acquittal on 7 charges, on 18 charges a majority voted not guilty, on 4 the vote was a tie, on 5 a majority said guilty, but on only 2 charges did the necessary two thirds say guilty. These were that the judge had set aside the writ of *habeas corpus* by instructing a sheriff to hold a prisoner, no matter what the decision of Judge Estes might be, and trying by threats to compel a wife to relinquish to a trustee \$10,000 in property that the circuit court had decreed to her in divorce proceedings.

A resolution was then unanimously adopted, formally declaring Judge DuBose convicted of misdemeanor in office and forever barring him from holding office in the State. The costs, amounting to about \$9,000, were charged to the defendant.

TEXAS, a Southern State, admitted to the Union Dec. 29, 1845; area, 265,780 square miles; population, according to each decennial census since admission, 212,592 in 1850; 604,215 in 1860; 818,759 in 1870; 1,591,749 in 1880; and 2,235,523 in 1890. Capital, Austin.

Government.—The following were the State officers during the year: Governor, James S. Hogg, Democrat; Lieutenant-Governor, M. M. Crane; Secretary of State, George W. Smith; Treasurer, W. B. Wortham; Comptroller, John D. McCall; Attorney-General, Charles A. Culbertson; Superintendent of Public Instruction, J. M. Carlisle; Commissioner of the General Land Office, W. L. McGaughey; Commissioner of Insurance, John E. Hollingsworth; Railroad Commissioners, John H. Reagan, L. L. Foster, W. P. McLean; Chief Justice of the Supreme Court, John W. Stayton; Associate Justices, Reuben R. Gaines and John L. Henry, who resigned in May, and was succeeded by T. J. Brown, appointed by the Governor on May 31. Court of Criminal Appeals—Presiding Judge, James M. Hurt; Judges, W. L. Davidson, E. J. Simkins. Court of Civil Appeals, First District—Presiding Judge, C. C. Garrett; Judges, F. A. Williams, H. Clay Pleasants; Second District—Presiding Judge, B. D. Tarlton; Judges, H. O. Head, J. W. Stephens; Third District—Presiding Judge, H. C. Fisher; Judges, W. M. Key, W. E. Col-lard; Fourth District—Presiding Judge, J. H. James; Judges, W. S. Fly, H. H. Neill; Fifth District—Presiding Judge, Henry W. Lightfoot; Judges, N. W. Finley, Anson Rainey. The Fourth and Fifth Districts were created by the Legislature this year, and the judges therein were appointed by the Governor in May.

County Debts.—On Jan. 1, 1893, the bonded debt of Texas counties was \$3,411,541.93 and the floating debt \$608,944. One year previous the figures were \$7,143,258.88 and \$511,519.32 respectively.

Legislative Session.—The Legislature convened at Austin on Jan. 10 and adjourned on May 9. On Jan. 24 Hon. Roger Q. Mills, Democrat, was re-elected United States Senator for the full term of six years from March 3 by the following vote: Senate—Mills 29, Thomas L. Nugent, Populist, 1; House—Mills 114, Nugent 8, N. W. Cuney, Republican, 1. For the purpose of refunding that part of the State debt

already payable the Governor was authorized to issue 4-per-cent. bonds to the amount of \$334,500, payable in forty years, but redeemable at the option of the State after five years, such bonds to be substituted for the past-due State bonds held by special funds so far as practicable, and the remainder to be sold. Authority was also given for the issue of nonnegotiable 5-per-cent. bonds to the amount of \$152,000, payable to the State University. These issues provide for the retirement of the following past-due bonds: \$200,000 of 6 per cents., act of 1885; \$25,500 of 6 per cents., act of May, 1871; and \$261,000 of 7 per cents., act of December, 1871.

An important result of the session was the passage of an act limiting the issue of stocks and bonds by railroads. It is provided that the Railroad Commission shall report to the Secretary of State the value of each railroad in the State, including all its franchises and property, and the value so fixed shall be the limit to which bonds or other indebtedness secured by lien or mortgage shall be issued by the company. The commission may from time to time modify its report of value to promote the public interest. Every judicial or other sale of any railroad that shall have the effect to discharge the property so sold from liability in the hands of purchasers for claims for damages, unsecured debts, or junior mortgages, shall have the effect to cancel all claims of every stockholder therein to any share in the stock of such railroad, and it shall not be lawful for the purchasers or for any railroad company organized hereafter to operate that railroad, to issue any stock in lieu of the old stock, or to allow any compensation therefor, nor shall any part of the debt to satisfy which such sale was made be continued or held as a claim or lien on said property. Provision is made in case a company building a railroad desires to issue bonds in advance of its completion. The value of stock issued shall in no event exceed the value of the railroad property, fixed as above stated, and the manner of its issue is strictly regulated.

An act designed to destroy large holdings of agricultural land by corporations provides that every private corporation whose principal business is the acquisition or ownership of land shall within fifteen years make an actual *bona fide* sale of all the lands now held by it, and that no such corporation shall hereafter acquire land within the State. All land not so disposed of within the period shall escheat to the State. But these provisions shall not apply to lands within incorporated towns, cities, or villages, or to land within 2 miles of the limits thereof. All other corporations are restricted to the ownership, outside of these limits, of so much land only as is necessary for their business.

A State live-stock sanitary commission of 3 members was established, and its duties in protecting and preserving the health of live stock were defined.

An "anticscalper" law requires every ticket-agent in the State to obtain a certificate of authority from the company or companies whose agent he purports to be, and to display it conspicuously in his office. All persons not having such authority and selling tickets are subject to a heavy fine.

Individuals, corporations, and firms were prohibited from employing in the State any armed force of detectives or other persons not residents thereof.

The public-school law was amended in matters of detail. The State was divided into 5 supreme judicial districts instead of 3, as previously arranged, and a court of civil appeals was established in each of the 2 new districts.

The Penitentiary board was authorized to purchase farms on which convicts may be employed on the State's account, and to borrow the necessary money from the permanent school fund, the expenditure for this purpose being limited to \$300,000.

Life-insurance companies and life and accident insurance companies were made liable for an annual tax of $1\frac{1}{2}$ per cent. on their gross premium receipts in the State; and fire, marine, health, live-stock, guarantee, and accident insurance companies were taxed one half of one per cent. on such receipts. Each telephone company was required to pay an annual tax of 25 cents for every one of its telephones in the State. An annual franchise tax of \$10 was levied on each private domestic corporation and on each foreign corporation having permission to do business in the State.

Two amendments to the Constitution were proposed, and provision was made for their submission to the people in November, 1894. One authorizes the establishment of a home for disabled Confederate soldiers and sailors; the other provides for the election of railroad commissioners by the people. Other acts of the session were as follow:

Authorizing minors to bring suit by next friend.

Making the first Monday in September a legal holiday, to be called Labor Day.

Providing for the distribution of the direct tax refunded to the State under an act of the Fifty-first Congress.

To authorize the rescue of girls and boys under the age of twelve years from the custody of improper persons.

To provide for determining the rights of nonresidents, persons unknown, and transient persons to property in the State.

Authorizing the Governor to call to his aid two persons, who shall perform such duties as he may direct in disposing of applications for pardon, and who shall be known as a board of pardon advisers.

To punish persons enticing minors away from the custody of their parents or guardians, and to give certain benevolent institutions and orphan's homes the rights of guardians over minors surrendered to them.

Appropriating \$10,000 for the relief of the city of Cisco and other portions of Eastland County which were visited by a tornado on April 28, 1893.

To define who are and who are not fellow-servants, and to prohibit contracts between employer and employee based upon the contingency of the injury or death of the employee, and limiting the liability of the employer for damages.

Under the law authorizing the Governor to veto separate sections of appropriation bills, Gov. Hogg struck off appropriations made at this session aggregating about \$350,000. He also vetoed an act authorizing the superintendent of the Penitentiary to receive from the United States the bounty that might be claimed upon sugar raised on the Penitentiary farms. His objections were based upon the character of the

Federal law authorizing the payment of this bounty.

Impeachment Trial.—On April 6 a committee appointed to investigate charges made against Land-Commissioner W. L. McGaughey made a report to the Lower House of the Legislature recommending his impeachment, and on the following day a committee of ten was appointed to prepare articles of impeachment. Under this authority a list of 25 articles was presented, in which the commissioner was charged with selling school lands to persons not actual settlers thereon and at prices below their real value, with willfully misconstruing the provisions of law respecting sales of school lands, with colluding with purchasers, with allowing unauthorized persons to have access to the files of his office, with refusing to renew leases on application, and with other grave misdemeanors. A demurrer and an answer to these charges were filed by the commissioner on April 20. The demurrer was first argued, and on April 28 was sustained in respect to 10 of the articles. On the remaining 15 charges a trial was had before the bar of the Senate, lasting until May 5, when the defendant was acquitted upon every article, not more than 8 votes being cast against him on any article.

Penitentiary.—On Oct. 1 the number of State convicts was 3,763, an increase of 188 over the figures for Oct. 1, 1892. Of this number, 971 were on contract farms, 258 on share farms, 192 on the Harlem State farm, 173 on railroads, 1,135 at the Penitentiary at Rusk, and 1,034 at the Huntsville Penitentiary. During the year the railroads dispensed with 415 convicts, 190 were added to the farm labor, and 419 were added to the population at Rusk and Huntsville.

Agriculture.—The official statistics of agriculture for 1892 include the following:

PRODUCT.	Acres.	Value.
Cotton.....	4,520,310	\$77,270,335
Corn.....	3,166,858	23,429,125
Wheat.....	442,887	5,944,908
Oats.....	473,708	5,182,626
Millet.....	35,955	423,792
Sweet potatoes.....	29,928	1,147,658
Irish potatoes.....	8,000	497,641
Hay (cultivated)....	80,233	890,494
Hay (prairie).....	179,168	1,503,764
Hay (sorghum).....	41,180	567,019
Sugar-cane, sirup, and sugar.....	14,015	981,077
Sorghum sirup.....	13,519	497,406
Melons.....	16,243	576,082
Peaches.....	51,750	1,289,551
Apples.....	11,428	289,856

Manufactures.—The number of factories in the State in 1892 was 6,657; the value of materials used was \$21,927,471; the value of the finished product was \$36,950,864; and the number of operatives 37,763.

Timber.—There are 25,000,000 acres of timber land in the State. Ten counties produce the long-leaved pine, namely: Angelina, Hardin, Jasper, Nacogdoches, Newton, Polk, Sabine, San Augustine, Trinity, and Tyler.

The Austin Dam.—On May 2, 1893, the last stone was laid completing a great dam across the Colorado river at Austin (see "Annual Cyclopædia" for 1892, pp. 252-254). The lake formed by the dam is nearly 30 miles long and nearly a quarter of a mile wide. It is estimated to con-

tain 2,800,000,000 cubic feet of water, or 21,000,000,000 gallons. The estimated available horse power is 14,500 for ten hours a day. The dam stands in the channel of a river, which has 40,000 square miles of watershed, and will have floods of 250,000 cubic feet of water per second to pass from crest to base. No other dam in existence has to pass a volume of water in flood even approximating this through so great a height. The primary object of the work was to furnish the city with water and with power for lighting.

Lynch Law.—On Feb. 1, at Paris, a negro named Henry Smith, charged with ravishing and murdering a three-year-old child, was lynched by a mob of citizens under circumstances of extreme cruelty. Such were the revolting features of the case that Gov. Hogg, on Feb. 6, made it the subject of a special message to the Legislature, in which he says:

Brushing away sentiment, which should never accompany punishment for crime, the public murder committed at Paris is a disgrace to this State. Its atrocity, inhumanity, and sickening effect upon the people at large can not be obscured by reference to the savage act of the culprit himself in brutally taking the life of an innocent child. For his deed the death penalty awaited him under the law. The imputation that he could not have been legally executed any court in this State is a slander upon the integrity of every citizen. To contend that his executioners, who publicly murdered him, can either be indicted or tried in the county where that crime was committed, is a pretense and a mockery. So the condition exists in our State that, while one man may be convicted for murder, a hundred men who publicly commit murder can not be. The laws, therefore, without further legislation, may be held in defiance in any community where the forces are strong enough to overawe the local officers and set aside the legal machinery of justice. Our Constitution is not so hidebound that this condition must continue. It is in the power of the Legislature to adopt suitable measures to either prevent mob law or to bring to punishment all murderous executioners.

Although the Governor made several recommendations designed to prevent such scenes in the future, the Legislature failed to enact any law pursuant thereto.

THEOSOPHY, "the science of divine wisdom." Its disciples are supposed to be doing all they can to attain a high condition of spirit. They believe not only in a spiritual existence after death, but in numberless flesh-and-blood lives on this and other planets. They believe in the re-incarnation of spirit, or "re-embodiment," as they call it. "The evolution of man is not a process carried out on this planet alone. It is a result to which many worlds, in different conditions of material and spiritual development, have contributed, and the earth is merely one link in a mighty chain of worlds. The system of worlds is a circuit round which all individual spiritual entities must pass, and that passage constitutes the evolution of man. The higher evolution will be accomplished by our progress through the successive worlds of the system, and in higher forms we shall return to this earth again and again." Another authority declares that "theosophy is religion, science, and philosophy, and these three at once: a religion because it aims to know, to become, and therefore to worship the truth; a science because it examines by strict analysis all processes in nature, in order to dis-

cover that which is; a philosophy because, by logical synthesis from the facts of nature discovered by science, it deduces the laws that underlie phenomena and govern the universe. Theosophy is therefore the work of a lifetime—nay, of many lives or incarnations."

The movement began in the United States in 1875, when the society was formed in New York city by Madame Helene Petrowsky Blavatsky and Col. Olcott. At that time there were not a dozen adherents to be found, while now the membership of the organization is over 100,000. Its conception was due to Madame Blavatsky, who believed that the interests of religion and science would be promoted by the revival of Sanskrit, Pali, Zend, and other ancient literatures, in which the sages and initiators had preserved for the use of mankind truths of the highest value. It was deemed best to organize a society whose first object should be to form the nucleus of a universal brotherhood of humanity, without distinction of race, creed, sex, or color. Once formed, the society was to promote the study of Aryan and other Eastern literatures, religions, and sciences. The third object was the investigation of the unexplained laws of nature and the psychical powers of man. A few years ago Madame Blavatsky wrote the book "Isis Unveiled." Having organized the society and aroused public interest to some extent by the apparent exhibition of occult power, she sailed for India, accompanied by several followers. In 1884 the society had grown to such proportions that the founders were invited to visit England, where a branch society had been formed, with A. P. Sinnett, author of "The Occult World," as president. Mr. Sinnett was editing an English paper in Allahabad when Madame Blavatsky and Col. Olcott went there, in 1879, to organize a branch society. Madame Blavatsky made friends and enemies everywhere she appeared by denunciations of spiritualism. She had a habit of making startling predictions, and usually in such an ironical manner that it was almost impossible to decide whether she meant what she said or was merely trying to make others commit themselves. She could produce a sound like a chime of bells, low and sweet, but perfectly clear, and this was heard under various conditions. She would know what was going on in other parts of the building, and one day reproached one of her party for something that was said in the park, a mile from the castle. Her hostess said that Madame Blavatsky had not left her room all the afternoon. One of her visitors wrote thus: "I remember an occasion when I excused myself to go to my room to write. In the evening, when we all assembled in the drawing-room, I was astonished to have her say to me: 'You have not written to-day; I saw you idling the time away.' It was true that I had sat at the large window the entire afternoon, looking out upon the hills, watching the clouds, and pondering over many things. Madame Blavatsky had been much in my thoughts, as I considered the question—a grave one to me—of remaining longer with the party or of returning to England. She knew by some means what had been agitating my mind, and said to me as we passed down the stairs: 'You will go back with me!' I said to myself that I would not; but

events so shaped themselves that I did travel back to London in her company. With no ambition, no home, no home ties, no strong attachment, she seemed alone in the world, and was in many respects the most indifferent person I ever knew."

Besides the "Isis Unveiled," the "Sacred Doctrine," and other works by Madame Blavatsky, the modern literature of theosophy includes "The Occult World" and other works by Mr. Sinnett. A branch of the Theosophists in the United States is led by Prof. Elliott Coues, of the Smithsonian Institution. In a lecture delivered in the city of New York in 1889, Prof. Coues spoke of modern miracles. He condemned the commercial kind of spiritualistic *séances*, but he maintained that the phenomena of spiritualism were so generally experienced that it no longer lay in the power of any one to deny the spiritual existence. The astral body could certainly make itself manifest to some beings—to such as were in sympathy allied to it; but only those who had been initiated could understand the mysteries of theosophy and enjoy its philosophy. To these there are no mysteries. In the astral existence, time and space do not embarrass as they do in the material existence, and the range of the astral intelligence is not limited by them. The number of those who sincerely desire to receive the light of theosophy and to believe is rapidly on the increase.

The third annual convention of the American Section of the Theosophical Society was held in Chicago in April and May, 1889. Dr. A. Keightly, of London, was present as the representative of Madame Blavatsky. A letter was read from Col. Olcott, in which he said that he was in Japan, preaching Buddhism, and that he delivered his first sermon at Kobe, in the temple of Mofatō, where Buddhism was first taught in Japan. A letter was read from Madame Blavatsky, saying that "Col. Olcott is on a visit to Japan, invited by a strong and influential deputation to lecture there on Buddhism among people who are mad and crazy to acquire Western civilization, and who believe it can only be obtained by the suicidal adoption of Christianity." Madame Blavatsky made an appeal to her American followers to recognize that the altruism of theosophy was not an ideal, but must be practiced, saying she had no faith in the future of the order if her followers did not make the vital factor of theosophy a part of their lives. "The enemies of the order," she wrote, "are materialism, prejudice, obstinacy, and the lower order of phenomenalists, the blind worshipers of illusionary phantoms of the dead," by which she meant spiritualists and others who "talk so glibly of magic, occultism, adepts, etc." She announced the secession of the French journal "Lotus" from theosophical doctrines, and said that "La Revue Théosophique" had been established in its stead in Paris. She and the Countess D'Adhama were the editors. There was also a request in the letter that the term "esoteric" be used less frequently, as it was "a term that had been discredited by Boston people." Madame Blavatsky died in 1891.

The opponents of theosophy, speaking through a recognized medium, say that "it is the most cheerless and hopeless of all the creeds known to

the world, proclaiming existence itself to be the curse of mankind; and, while ready to accept millions of deities into its pantheon, is in reality atheistic, as knowing of no absolute being worthy of the name of God—none that may not be plunged to the lowest depths of degradation in his next stage of existence—and yet it has found its propagandists in America. No doubt there is something in the spirit of our times which fits into this dismal creed, and makes possible its acclimatization in the Western world of Europe and America."

TIN-PLATE INDUSTRY IN THE UNITED STATES. The first attempt to raise the tariff on tin plates, so that they could be made in the United States, was in 1864. The tariff of that year contained this provision: "On tin plates, and iron galvanized or coated with any metal, by electric batteries or otherwise, 2½ cents per pound." Some doubt having arisen as to the construction of this clause, the Secretary of the Treasury, Hon. William Pitt Fessenden, at once gave the following opinion: "It would appear that an error of punctuation has been made by some one, most probably by the clerk who engrossed that part of the act. If the comma which is inserted after the word 'plates' be omitted, and a comma placed after the word 'iron,' the true sense will be had, which unquestionably is, that the tin plates, as well as the iron, must be galvanized or coated with any metal by electric batteries or otherwise in order to bring them within this provision." It was claimed by those who depended upon the enactment of the tariff that the loss of it postponed the making of tin plates in the United States. But there appears to have been an *ad valorem* duty of 25 per cent. between 1867 and 1873.

In 1873, 1874, and 1875 tin plate was made at Wellsville, Ohio, Leechburg, Pa., and Denmmier, Pa. But the Welsh manufacturers cut the prices from \$13 to \$10; then to \$9, \$8, \$7, \$6, and \$5; and finally to \$4.50 a box, in order to meet the opposition. The plate was also made, in limited quantities, at Pittsburg and at Martin's Ferry, Ohio, in 1889. The presidential and congressional elections of 1888 having been favorable to the Republicans, they found themselves, in 1889, in full control of the executive and legislative branches of the Government. A new tariff act, popularly called, after its author, the "McKinley bill," was passed Oct. 1, 1890. The "Mills bill," which passed the Democratic House of Representatives in July, 1888, placed tin ore, pig tin, and tin plates on the free list, but it did not become a law.

The McKinley bill placed tin ore, cassiterite or black oxide of tin, and tin in bars, blocks, pigs or grain, or granulated, on the free list till July 1, 1893. After that date they were to pay a duty of 4 cents a pound. But if the product of the mines of the United States should not in some one year before July 1, 1895, exceed 5,000 tons of cassiterite, and bar, block, and pig tin, then the President must issue a proclamation announcing the fact; and, after July 1, 1895, all imported cassiterite, bar, block, and pig tin shall be admitted free of duty. The effect of this provision was to develop the resources of the tin mines at Temescal, Cal., at Harney Peak, South Dakota, and at several points in Virginia. Tin

was also discovered near San Antonio, Texas. (See the "Annual Cyclopaedia" for 1890, page 801.) An analysis of the ore showed that it yielded a larger percentage of tin than the ore from Wales, Australia, or the Straits Settlements in the Malay Peninsula. From present indications, it is doubtful if the product of the mines in the United States will come up to the requirement by July 1, 1895. The imports of tin in bars, blocks, pigs, etc., were as follows for the last two fiscal years, each fiscal year ending with June 30: 1892, 48,908,653 pounds, valued at \$8,607,870; 1893, 61,073,930 pounds, valued at \$12,358,999. The McKinley bill placed a duty of 1 cent a pound till July 1, 1891, on sheets or plates of iron or steel, or taggers iron or steel, coated with tin or lead, or with a mixture of which these metals, or either of them, is a component part, by the dipping or any other process, and commercially known as tin plates, tinned plates, and taggers tin.

On and after that date, tin plate, tinned plate, and taggers tin shall pay 2 cents per pound; and manufactures of which tin, tin plates, tinned plates, taggers tin, or either of them, are component materials of chief value, and all articles, vessels, or wares manufactured, stamped, or drawn from sheet iron or sheet steel, such material being the component or chief value, and coated wholly or in part with tin or lead or a mixture of which these metals or either of them is a component part, shall pay a duty of 55 per centum *ad valorem*; Provided, that on and after Oct. 1, 1897, tin plates and tinned plates lighter in weight than 48 pounds per hundred square feet shall be admitted free of duty, unless it shall be made to appear to the satisfaction of the President (who shall thereupon by proclamation make known the fact) that the aggregate quantity of such plates lighter than 48 pounds per hundred square feet produced in the United States during either of the six years next preceding June 30, 1897, has equaled one third the amount of such plates imported and entered for consumption during any fiscal year after the passage of this act, and prior to said Oct. 1, 1897. Provided, that the amount of such plates manufactured into articles exported, and upon which a drawback shall be paid, shall not be included in ascertaining the amount of such importations: And provided further, that the amount or weight of sheet iron or sheet steel manufactured in the United States and applied or wrought in the manufacture of articles or wares tinned or tinned plated in the United States, with weight allowance as sold to manufacturers or others, shall be considered as tin and tinned plates produced in the United States within the meaning of this act.

The table in the next column shows the quantity of tin plates, tinned plates, and taggers tin imported since there has been a duty of some sort (1867-'93) together with the value, rate of duty, and amount of duty collected.

From the enactment of the McKinley bill, in October, 1890, to the present time the actual condition of the manufacture of tin plates has caused more political discussion than any other subject covered by the new tariff. Those who favored the tariff, and especially the manufacturers who took advantage of its provisions, claimed that the United States now had a chance to make all its black plates, either of iron or steel, and, in time, to coat them with tin mined on its own soil. On the basis of the importation of tin plates for 1891 it was figured that 1,100,000 tons of iron ore, making 350,000 tons of pig iron, would be required for the manufacture of 423,294 tons of black plates

* Lighter than 48 pounds per 100 square feet. † All other.

represented by the importation of 1891; and that the labor of nearly 30,000 men would be used in producing the iron ore, the pig iron, the coke and the coal, and in running the plate mills and the tin mills. Add to this number the men employed in mining the tin, and nearly \$50,000,000 in wages would be paid yearly in the United States instead of being paid to foreign workmen.

On the contrary, those who opposed the provision in the McKinley bill relating to tin plate asserted that it was foolish to protect an industry that had not been born; that higher prices would hereafter be paid for home-made tin plate, thus raising the price of canned goods to the consumer or else reducing to the farmer the price for the articles to be canned; that the larger the importation of tin plate, the less would be its cost in the United States; and that it would be impossible for the United States to produce enough tin and tin plate to come up to the requirements of the McKinley tariff, and much more impossible to produce enough for home consumption.

The first tin mill in the United States under the McKinley tariff was opened in the Black Hills, South Dakota, in 1890. Mills were afterward opened in New York, Brooklyn, Chicago, Pittsburg, St. Louis, Philadelphia, and Cleveland; and in various smaller places in Pennsylvania, Ohio, Indiana, and Illinois. The present number of mills is 50, of which 42 are manufacturing, and 40 are reporting to the Treasury Department. In March, 1891, the English manufacturers sent a circular to the trade, dropping the price of tin plate \$34 a ton, the amount of the extra duty. This was in anticipation of the duty, under the McKinley tariff, that went into effect July 1, 1891.

From sworn statements made by the manufacturers to the Treasury Department, it appears that for the first quarter, ending Sept. 30, 1891, 5 factories reported a product of 152,489 pounds of tin plate and 674,433 pounds of terne plate—a total of 826,922 pounds. The statistics, from the same source and to the same department, showed that during the fiscal year ending June 30, 1893 (40 factories having reported in the last quarter), the tin and terne plates manufactured aggregated 13,646,719, of which 9,296,553 were from American black plate and 4,350,166 were from foreign black plate. Those manufactured during the fiscal year ending June 30, 1893, aggregated 99,810,202, of which 43,599,724 were from American plate and 56,219,477 from foreign plate. There were 5,620,867 pounds of American sheet iron and steel made into articles and wares, tinned or terne plated, during the fiscal year 1892; and 8,802,681 pounds made during 1893, making the aggregate manufacture of tin and terne plates in the United States during 1892 19,267,586 pounds, and 108,621,885 pounds during 1893. The total number of American plates used was as follows: 1892, 14,917,420 pounds; 1893, 52,402,405 pounds. The total production of black plates during the fiscal year 1893 was 63,681,541 pounds. The output of tin and terne plates proper of the lighter class during the fiscal year 1893 was 93,850,487 pounds, showing an excess over and above what may be termed the one-third requirement of 14,542,548 pounds. This, the report says, is exclusive of the manufacture of American sheet iron and steel made into articles and wares tinned or terne plated. According to the report, this would indicate that the entire consumption of the United States during the fiscal year 1893 was 720,000,000 pounds, of which more than 15 per cent. was of American manufacture. Of the commercial plates manufactured during the fiscal year ending June 30, 1892, about 83 per cent., and of those for the fiscal year ending June 30, 1893, nearly 46 per cent. were tinned as distinguished from terne. During the fiscal year first above named 90 per cent. of the output of commercial plates consisted of the class weighing lighter than 63 pounds per 100 square feet; and during the last fiscal year, 94 per cent.

On Sept. 30, 1891, the special agent of the Treasury Department, who had charge of gathering the statistics, figured that the American manufacturers, in order to maintain the duty on tin plates after Sept. 1, 1897, must produce in one of the six years ending at that date 50,000,000 pounds of tin and terne plates weighing lighter than 63 pounds to the hundred square feet. The report of the special agent, April 26, 1892, declared that, by the terms of the McKinley tariff, the largest year of production may be compared with the smallest year of importation in the final determination as to whether domestic manufacturers have complied with the one-third requirement, relative to production, as set forth in the act. Under a ruling of the Treasury Department, the coating of metal sheets, or "black plates," as they are called, whether of American or foreign manufacture, with a tin or terne coating, constitutes a manufacture of American tin plates within the meaning of the law. It has been held that the tin

used for the coating, whether of tin or terne plates, may be either of American or foreign production. On the other hand, with respect to the sheet iron or steel applied or wrought in the manufacture of articles or wares tinned or terne plated in the United States, the Department has rigidly held that they must be of American production, as the law explicitly refers to "sheet iron or sheet steel manufactured in the United States." It is not understood that the limitation relative to minimum weight applies to these manufactures, the last proviso of paragraph 143 being silent upon that point. After the reports for the fiscal year ending June 30, 1892, had been received, the amount required of American manufactures, in order to keep the duty on tin plates at 2½ cents a pound, was figured at 79,307,939 pounds. The report of Sept. 18, 1893, declared that the output of tin and terne plates proper of the lighter class during the fiscal year ending June 30, 1893, was 93,850,487 pounds, showing thereby an excess, under the former interpretation of the law, over and above what may be termed the one-third requirement of 14,542,548 pounds. This was exclusive of the manufactures of American sheet iron and steel made into articles and wares tinned or terne plated. The total production of commercial tin and terne plates from American black plates of the lighter class during the fiscal year ending June 30, 1893, was about 94 per cent. of the product from that source, or 40,983,741 pounds. To this add 8,802,681 pounds of products from American sheet iron and steel, tinned or terne plated, and there is a total of 49,786,422. In other words, the product from American plates during the fiscal year ending June 30, 1893, of the kind subject to comparison with the net imports of the lighter class of plates, was five eighths of the amount necessary to enable manufacturers to meet the one-third requirement under the law, comparison being made with the net imports of the fiscal year ending June 30, 1892.

The making of tin and terne plate is one of the simplest of all processes of manufacture. In tin plate the steel or iron plates form from 93 to 97 per cent. of the weight, the remainder being pure tin, or tin mixed with a small quantity of antimony or lead. In any quantity of terne plate, used chiefly for roofing, 95 per cent. is steel or iron, and the remainder two parts of lead to one of tin. For commercial purposes, tin plates are divided into two classes, which are termed "charcoal plates" and "coke plates," according as charcoal or coke is used in the manufacture of the iron bars from which the plates are rolled. The plates are carefully cleaned and pickled by being immersed in hot diluted sulphuric acid. The sheets are placed on edge in a wooden rack, and the whole is immersed in acid. A mechanical arrangement imparts to the rack holding the sheets a regular up-and-down motion, thus maintaining a circulation in the acid bath. When all the scale, or oxide, has been dissolved, the rack holding the sheets is immersed, and the whole is washed several times in fresh water. The sheets are then dried, packed in annealing boxes or pots, and annealed twelve to twenty-four hours in a reverberatory furnace. This softens the sheets, and

they will readily take a polish when cold-rolled in the next operation. The sheets are passed singly through a series of heavy, high-polished cold rolls. After the rolling the sheets become harsh, and to remove this they are again annealed in the same way. They are then pickled a second time. The sheets are plunged into heated tallow to drive away the water without oxidation of the metal. They are next placed in a bath of molten ferruginous tin, and then in a bath of pure tin. In this they soak twenty minutes, the tinman constantly opening and re-opening the pack with his tongs. The tinman hands them to the washman, who plunges them into the washpot filled with tin. They are next placed upon a flat iron plate, and the washman brushes the two sides, removing the excess of tin between them. To give the sheets a polish, the sheets are dipped, one at a time, in the smaller compartments of the washpot. Without removing the sheet from the tongs, it is passed between a pair of steel rolls into the patent pot. Passing through these rolls into tin below, it is caught, moved along, and raised by means of a cradle to meet another pair of rolls revolving in the surface of the tin bath. Thus as one sheet is rolled into the bath another is rolled out. The sheets are placed in a rack to cool, after which they are rubbed with sawdust or bran to remove the grease. They are polished with flannel or buckskin, and removed into the sorting room for examination and classification. The tests are durability, strength, and color. Besides the acid process, described above, the palm-oil process is sometimes used. But this is a slower and more expensive method, and on that account preference is generally given to the acid process.

TORPEDOES. *Submarine Mines.*—The torpedo as a weapon of warfare has made great advance within the past fifteen years, both in its offensive and defensive forms, or, in other words, as movable constructions and as anchored mines. In the latter form they are technically known as "submarine mines," and it is to this division of the subject that we shall now call attention. Anchored mines are used almost exclusively for the defense of harbors, and in the present development of warfare are rarely utilized for the protection of shipping out of port. The complicated construction and apparatus consequent on that electrical connection, now generally used for firing mines, make them impracticable, except where they can be laid from a fixed station. The older methods of mechanical ignition are now for the most part obsolete. (For history and earlier stages of submarine mining see "American Cyclopædia," vol. xv, page 802, and "Annual Cyclopædia," vol. ii, p. 717.) The American school of submarine mining is at Willet's Point, the headquarters of the engineer battalion of the army, at the throat of Long Island Sound, about 8 miles from New York. Here thorough instruction in this branch of the military art is given to engineer and other army officers, as also to the enlisted men of the engineer corps, and material is stored to meet emergencies. The principles underlying the American system are of course the same as those adopted by the military engineers of the more advanced European nations, but in some im-

portant minor applications of these principles there are features peculiar to our service.

There are also certain secrets involved in the details of the working and employment of the American torpedo system which are not made known. These are the constructions of the "circuit closer" and of the "firing box," and the plots of the torpedo fields designed for the vari-

A BUOYANT TORPEDO.

ous harbors of the country. In the latter case the secret is kept within the *penetralia* of the War Department, a thing not even intrusted to engineer officers until the actual need of laying torpedoes arrives. But these may be illustrated without trenching on the actual facts.

Submarine mines may be divided into two general classes—electro-contact and self-acting mines. The latter have within themselves the means of ignition in the shape of a small battery of a few cells, and are equally dangerous to friendly and hostile ships. They are only used at times of great urgency or in less important channels to supplement the others. Their simplicity of structure and freedom from complicated shore attachment make it possible to lay them with great rapidity. But they are liable to become rapidly ineffective as, once down, they can not be tested. For this reason, and the no less potent ones that they threaten all ships alike and can only be safely removed by exploding them, self-acting mines promise to become obsolete as the art of submarine warfare progresses. Electro-contact torpedoes are discharged by the shore circuit, and involve complicated electrical apparatus and the highest skill and judgment in their practical use. As compensation for this they can

be accurately tested in all their details of device, kept in perfect working order, and made to execute the commands given them with the precision of an infantry soldier at drill. This form of torpedo is one of the splendid triumphs of military science. Its terrors are docile and can be disarmed at a touch, and its obedience to orders is as swift as thought. It telegraphs ashore its own condition and that of all the electrical apparatus connected with it; it can instantly destroy on contact or signal to the "mining casemate" that a ship is in position for submarine attack and wait for the orders at the will of its master. It is almost like an intelligent creature. Mines working on the shore circuit can be laid so as to be at once transformable from "judgment" torpedoes (discharged at will) to those of automatic action; or they may be so arranged as to be capable of ignition only by judgment from the shore. These distinctions depend on the arrangement of the circuit-closer.

Torpedoes in their outer form are divided into buoyant and ground mines. The shape of the torpedo case adopted in the United States and to some extent in foreign countries is spherical, constructed of two hemispheres with heavy flanges welded together. This form of the sphere is found to be the strongest, the most capacious weight for weight, and to possess the greatest power of flotation. The metal is pressed out as thin as possible from low-carbon steel of the greatest tensile strength. In deep water, say more than seven fathoms, the buoyant form is used, while in shallower channels the ground mine becomes desirable, as it can take a much heavier charge of explosive. The question of weight in relation to buoyancy here ceases to be a factor. The ground mine is hemispherical, adhering to the bottom by its own weight, and the buoy, consisting of an unloaded torpedo sphere, floats above it at from 10 feet to 20 feet below the level of ebb tide.

The buoyant mine is anchored to the bottom. The circuit-closing apparatus is in the very heart of the torpedo itself, and so constructed that when the electric current is turned on, a very slight shock to the torpedo case discharges it. On the other hand, in the case of a ground mine the circuit-closer is in the buoy above the torpedo. The size of a torpedo varies according to the load it is intended to carry, the law of relative flotation, the strength of tide and current, the limits of tidal change, and the depth of channel. These must all be carefully calculated. It may be said that an average standard for a buoyant mine is 36 inches diameter. The explosive mostly in vogue for loading torpedoes is one of the higher powers of dynamite or other nitro-compound. In the American system it is the grade known as No. 1. The base of this is the infusorial earth known as *kieselguhr*, found in Hanover, Germany, which absorbs nitro-glycerin in the ratio of 8 to 1. No inert base known has so high a power of absorption. Another still higher form of explosive which has been adopted in England and Germany, and will probably come into use here, is "blasting gelatin," first made by Nobel, who was the discoverer of dynamite, and afterward improved by Prof. Abel, the chemist of the English War Department. The base of this is gun-cotton, which is also a nitro-

compound and a most powerful explosive. As it is soluble in nitro-glycerin, the compound is a pure explosive with nothing inert. For a time this explosive, the most energetic known, was dreaded as unsafe for handling. But the difficulty has been removed, and it can now be used with no greater precautions than dynamite, than which it has nearly 50 per cent. higher energy. An essential portion of the torpedo apparatus is the circuit-closer, which is ordinarily designed to be used with the fuse, either in or out of the permanent circuit. In the former case it can be fired either by a blow from an outside object or by judgment from shore; in the latter case only by a blow. The circuit-closer can either be inclosed in a separate case and connected with the mine by a mooring line and electric cable, or it can be included with the charge in the mine. A description of Prof. Abel's apparatus, which is the favorite form of the British War Department, will sufficiently indicate the general principles involved in the construction of all. The form illustrated is that in which the apparatus occupies a separate shell. It consists of a strong case made buoyant by means of an air-tight chamber.

Within is set a brass tube (d), into the lower extremity of which a pair of insulated wires (e and f) are introduced through a water-tight stuffing-box. Within the brass tube is another tube of brass or iron (A) extending vertically through the whole apparatus and working on a universal joint (i) at its lower extremity. The upper portion of this tube is rigidly connected

SECTION OF ELECTRIC TORPEDO.

with a metal bar (k), which is attached to a top (h) supported on the case (a) and separated from it by a vulcanized rubber ring (m). One of the insulated conducting wires (e), passing through

the metal tube *h*, is soldered on to a copper ring (*p*) encircling the bar (*k*) and insulated from it. The insulated conducting wire *f* passes through a hole in the tube *h*, and its bared extremity is attached to a binding screw (*q*), in connection with an insulated brass band, let into an ebonite ring, which is fitted around a hollow in the brass tube. When it is designed that the fuse shall be kept out of circuit till the moment of firing—that is, to explode solely from the effect of an outside shock—the electric cable from the firing battery is connected with the insulated wire *e*, the other pole of the battery being to earth; and the wire *f* is attached through an insulated conductor to one pole of the fuse while a metallic connection is arranged from the other pole of the fuse to earth. Firing the fuse only requires to bridge over the space between the copper ring (*p*) and the brass ring (*q*), with which the conducting wires are respectively connected. A vessel striking the top of the apparatus in any direction would effect this, as it would jar the bar (*k*), and by action of the universal joint (*i*) some part of the copper ring (*p*) would be brought into contact with the brass band (*q*), thus completing the circuit. When it is desired that the fuse should be arranged in permanent connection with the circuit the combination would be as follows: One pole of the firing battery being to earth, the other is connected by cable with one pole of the fuse, the other pole of the fuse being placed in metallic connection with the wire *e*, while the wire *f* is put to earth by being connected with the metallic portion of the case (*a*). A shock from above would at once bridge over the space between the rings (*p* and *q*), firing the fuse; or, on the other hand, the mine could be exploded at will from the mining casemate by connection with the firing box.

In England and Germany the circuit-closer is, in most cases, a separate attachment. The great objection to it is that the first object of an en-

being one hundred feet distant from the junction box, and the groups one hundred feet from each other. From the triple junction boxes issue single ones, which are joined together at the grand junction box into the multiple cable. This is carried ashore into the mining casemate, which is the firing station, and, passing to earth, completes the circuit. It will be seen from this description that each of the separate cores of the cable carries the electric current to a triple group, so that at no time can fewer than three be discharged from the shore. Any one torpedo, however, can be independently exploded by concussion from a passing vessel. The touch of a ship rings a bell in the mining casemate and breaks the circuit for five seconds, thus preventing the two nearest companions to the discharged mine from being exploded by mechanical shock from the disturbed water. If, on the other hand, the touch of a side or keel has possibly been too light to discharge a mine, the warning ashore gives an opportunity for the use of the firing box in the mining casemate to discharge the whole group of three. The fact that a group of mines can be made perfectly safe for the passage of friendly ships or merchant vessels is a point of great importance. The occasional failure of a mine to explode by contact, as might occur when touched by an outrigger, would be remedied by a warning to the electrician and his consequent action. In case of heavy fog or the smoke of battle hiding ships from view, thus preventing the tracking of them from theodolite stations on a chart, such reports from the torpedo itself would be of the greatest value, guiding action as to the policy and time of firing any special group. It is this combination of automatic action with power to communicate results to the shore station which constitutes the crowning triumph of the submarine mine. For example, hostile vessels are approaching the torpedo field. The commanding officer in the mining casemate suspends the auto-

ARRANGEMENT OF MINES.

emy attacking a harbor would be to explode the mines in his front, or, failing in this, to get hold of and carry off the circuit-closers, and break the cable connections, thus rendering the charges unexplodable. This would be much easier to accomplish if the apparatus were detached. The priming fuse generally used consists of fulminate of mercury, duplicated in several compartments. The fuse fits into a receptacle made to hold one pound of dynamite, which constitutes the main percussive charge to the whole mass. The unit of arrangement which determines the distribution of mines on the hydrographic plot is a grand group of twenty-one, subdivided into seven triple groups, as may be seen illustrated in the diagram. Each minor group is set in the shape of a triangle, the torpedoes

being one hundred feet distant from the junction box, and the groups one hundred feet from each other. From the triple junction boxes issue single ones, which are joined together at the grand junction box into the multiple cable. This is carried ashore into the mining casemate, which is the firing station, and, passing to earth, completes the circuit. It will be seen from this description that each of the separate cores of the cable carries the electric current to a triple group, so that at no time can fewer than three be discharged from the shore. Any one torpedo, however, can be independently exploded by concussion from a passing vessel. The touch of a ship rings a bell in the mining casemate and breaks the circuit for five seconds, thus preventing the two nearest companions to the discharged mine from being exploded by mechanical shock from the disturbed water. If, on the other hand, the touch of a side or keel has possibly been too light to discharge a mine, the warning ashore gives an opportunity for the use of the firing box in the mining casemate to discharge the whole group of three. The fact that a group of mines can be made perfectly safe for the passage of friendly ships or merchant vessels is a point of great importance. The occasional failure of a mine to explode by contact, as might occur when touched by an outrigger, would be remedied by a warning to the electrician and his consequent action. In case of heavy fog or the smoke of battle hiding ships from view, thus preventing the tracking of them from theodolite stations on a chart, such reports from the torpedo itself would be of the greatest value, guiding action as to the policy and time of firing any special group. It is this combination of automatic action with power to communicate results to the shore station which constitutes the crowning triumph of the submarine mine. For example, hostile vessels are approaching the torpedo field. The commanding officer in the mining casemate suspends the auto-

matic action of any section, or of a grand group, or of several groups. The observers at the theodolite station or stations engaged in tracking the course of the enemy's ships with reference to the torpedo locations, report the facts to the mining casemate. The electric current may be reserved from the circuit till several ships of the fleet, unwarned by explosion, are destroyed simultaneously when they reach favorable stations on the torpedo field. Strategy is thus made possible in the use of submarine mines. From first to last each step in the torpedo system is infallibly tested, and the testing never ceases.

Every detail of the complex apparatus can be examined from the mining casemate, and a fault located by electricity. The testing begins with the storage of material. The multiple

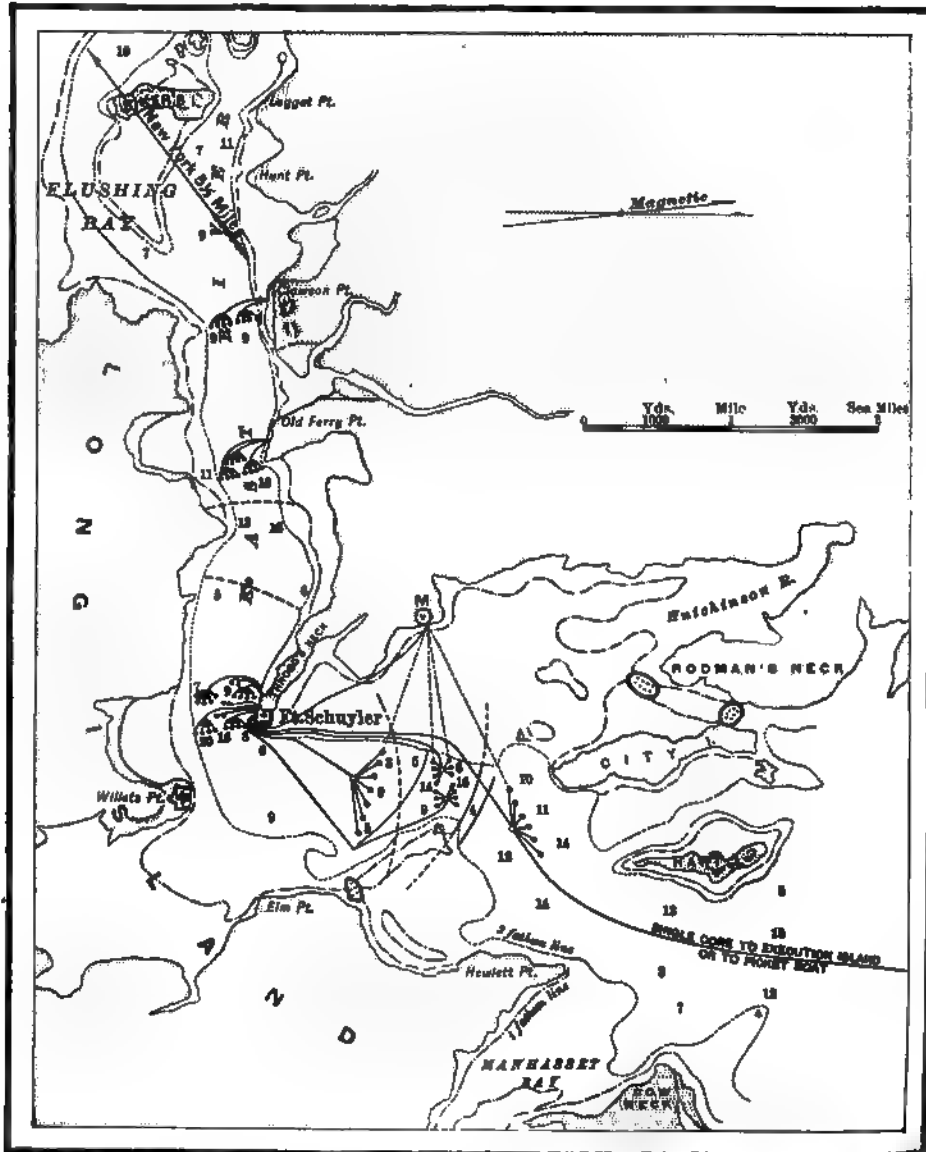

cables are stored in salt-water tanks, so that the outer coat is saturated and a defect may be discovered before it is laid. The dynamite and the fulminate in the primer are tested before loading the torpedo shells. With the laying of each separate mine the electrical connection is tested. When a grand group is laid every feature of it is daily examined, the multiple cable tested for insulation and conductivity, as well as each core and branch of a core. The fault can be located within a few feet. The junction boxes are subjected to a daily inquisition. A difficulty in the circuit-closer or its wire connections, a leak in the torpedo case, a wetting of the dynamite charge or the fulminate of the primer are at once made known and the fault properly placed. This is done by delicate electrical apparatus in which the galvanometer plays the most important part. The method may be illustrated in some of its applications in the use of the sea-cell test. First take, for example, the testing of the dryness of the dynamite charge. The principle of the sea-cell depends on the fact that two plates of suitable metal form a voltaic battery when placed in salt water and properly connected by a metal conductor. This battery will produce considerable deflection in the needle of a galvanometer, which varies in direction and violence with the metals used. There is a plate of zinc inside the dynamite charge at the point which connects it with the conductor of the cable between the fuse and the shore. There is also a plate of carbon connected with the wire beyond the fuse to form the earth connection, while a copper earth plate is used at the home end. In case the charge is dry, we should have a sea-cell composed of a copper and a carbon pair, which would produce a certain deflection on the needle of a galvanometer in circuit, say from right to left. If the charge is wet, the zinc plate would come in contact with salt water, and the sea-cell composed of a copper and a zinc pair would give a deflection of the galvanometer in the opposite direction. Again, suppose the insulation of the electric cable has become damaged to such extent as to expose the copper conductor. Under these conditions the sea-cell would be formed of two copper plates—one the permanent earth plate, the other the exposed conductor—and a certain kind and degree of deflection would be noticed. This deflection would differ in character from that produced by the copper carbon sea-cell, which would exist if the insulation were good, indicating a change in the electrical conditions and the probability that there had been an injury to the insulation of the cable. Now if the earth plate at the home end of the cable should be changed from copper to zinc or carbon, fresh combinations would give new indications on the galvanometer, and these would provide the means of determining with accuracy the reason for the change in the electrical conditions of the combination which they indicated. In this way the fact of a leak in insulation could be discovered. Its extent and position would be determined by further tests. Should the conductor of an electric cable be fractured within the insulation without injury to the latter, the sea-cell test would denote the fact, that lack of continuity in the conductor would result in lack of deflection in the galvanometer needle. Want of conductivity

or inefficient connections in the fuse would be similarly shown. When submarine mines are laid in expectation of the arrival of a hostile fleet, these tests are supposed to be daily applied to every portion of the mining apparatus. While the main current is dynamic electricity, the voltaic battery is generally used for the firing box and the testing table, as being more easily and economically administered for these uses. After the torpedoes are laid and fully adjusted, the question arises as to their methods of use in the exigencies of battle. Discharge by contact through the circuit-closer is already provided for in the torpedo apparatus. But in firing at will, means of exactly determining the vessel's position on the mining plot are necessary. This position is determined by intersection. The simplest and, on the whole, the surest plan is that which accomplishes this by theodolite observations from different stations, one of which may or may not be at the mining casemate, preferably the latter, as the firing station would in any case have electrical communication with both. Before the officer in the mining casemate, who has at his elbow the different firing boxes, lies a chart of the whole field of mines. It is divided into small squares, which show the precise location of all the mine groups, the definitions being made by the markings of the degrees of a great circle laterally and lengthwise. Remote points at some elevation, not likely to be discovered by the enemy, and at the end of a fixed base line are selected, which overlook the field of operations. These points are electrically connected with each other and with the mining casemate. At each of the observation stations an officer and his assistants take the readings, as indicated on the graduated scale of a theodolite telescope, of the moving vessel which is being tracked. The scales of the two instruments correspond, and of course the alignments intersect at the ship's location. The markings in degrees at the subsidiary station, constituting the record of one alignment, are telegraphed at once to the main station, and the officer there in command traces these in connection with the readings of his own alignment on the chart, or both alignments may be telegraphed to the mining casemate, and there traced on the chart. The movement of the point of intersection over the squares indicates the course of the ship and its precise relation to any torpedo group. If the theodolite scales are properly set and the officers and their assistants careful in their readings, this method is almost infallible except in case of heavy fog or battle smoke, when dependence would need be left to explosion by contact or the signaling from an unexploded mine. At night it would be necessary to make use of powerful search lights, an assistance also indispensable in guarding against attacks on the torpedo field at night by picket boats or other means of aggression on the part of the enemy.

The art of countermining has advanced proportionably with that of torpedo defense. This is accomplished mainly by heavy charges of dynamite or gelatin exploded over a suspected field of mines, or by boat parties with means of taking up buoyant mines, or the circuit-closers, of ground mines if detached, or of cutting the electrical connections. It is probable that any

hostile fleet would use both these means of destroying the dangers in its path before attempting a passage. The defense of the torpedo field would make necessary a patrol of lightly armored launches, equipped with batteries of Hotchkiss or other quick-firing pieces, and machine

possible. For this reason it is probable that the mining casemate and the observation stations for tracking ships would be remote and concealed as much as possible from observation. They could not safely be within the main line of shore works that covered and protected the field,

EASTERN TORPEDO DEFENSES OF NEW YORK.

guns to do skirmish and picket duty. All the stations used in making a system of submarine mines in time of war would needs be bomb proof. Once the enemy's ships had located these essential nerve centers of the defense, the fire would be concentrated, so as to make them untenable if

but would be connected therewith by telegraph keeping them under control of headquarters. To make more clear the principles on which the defense of submarine mines at the entrance of the harbor would be laid and utilized, an illustration is taken from a late work by one of the

distinguished English engineers, Lieut.-Col. Bicknell, R. E. (Ret.). This shows a plan for defending the Long Island Sound entrance of New York harbor. It is, of course, different from the plan of the United States official mining chart, but is sound and skillful. It is based on the following principles: First, that the mines should be scattered in groups as irregularly as may be compatible with their protection by light artillery and quick-firing guns mounted in proper emplacements; second, that they should be deep and narrow in plan, concentrated in the channels, with the center of each channel mined more than the sides; third, that they should extend right through the defense to the very last intrenchment.

To provide against a strong land attack in co-operation with that of the navy the topography of the region would force the erection of strong lines of earthworks at least two miles in the rear on both shores, thus preventing either Fort Schuyler or Willett's Point being taken in reverse. All the mining stations would be well within these interior lines. All the navigable waters to the west of Hewlett's Point and Elm Point would be mined. The firing and observation stations would be located on the north side. In the immediate front of the forts self-acting mines, charged with heavy loads of dynamite or gelatin would be used. The mining casemate would be located somewhat northwest of Fort Schuyler, far enough to be clear of the smoke and of the enemy's fire on the fort. This firing station would also be the main observation station with auxiliary at *M*, or perhaps a point a little farther from shore and less liable to boat attack at night. Four groups of mines converge on *M*, and the cables would be carried from that point to the mining casemate on Throgg's Neck. The two stations would be connected by cable containing separate cores for telephoning and telegraphing. These mines, being spread over a considerable extent of water, would be most useful against ships that might engage the forts at battering range. Other groups of mines to be fired from the same station might be planted between Hart's Island and Hewlett's Point, and another group in mid-channel just north of Willett's Point, if need be. All the side channels would be blocked with self-acting mines or passive obstructions or both, as, for example, between City Island and Redman's Neck and off Elm Point. Abreast of Fort Schuyler would be a mine field, consisting of four groups of electro-contact torpedoes, flanking a fair way or open passage with several pairs of observation ground mines (such as would be exploded solely from shore). Other mine fields in the rear are supposed to be planted at Old Ferry Point and at Clawson's Point. An attacking squadron that passed these obstructions and the forts at Fort Schuyler and Willett's Point would be within such cannonading range ($5\frac{1}{2}$ miles) of New York as would compel the city to make terms.

TURKEY, an empire in eastern Europe and western Asia. The Sultan, who rules absolutely under the moral limitations contained in the Mohammedan sacred laws, is the eldest prince of the family of Osman. Abdul Hamid II, the thirty-fourth sovereign of the line, born Sept. 21, 1842, succeeded his brother Murad V, who was

deposed on the ground of lunacy on Aug. 31, 1876. The Sultan is recognized as Khalif, or spiritual ruler, beyond the present bounds of the Ottoman Empire, being guided in his ecclesiastical policy by the Sheikh-ul-Islam and the Ulema, a body composed of eminent doctors of the law. In temporal matters the Sadrazam, or Grand Vizier, is the chief executive officer. These two functionaries, together with ministers of departments, form the Privy Council or Cabinet of the Sultan, which was composed in the beginning of 1898 as follows: Grand Vizier, Djavad Pasha; Sheikh-ul-Islam, Djemal Eddin Effendi; Minister of Foreign Affairs, Said Pasha; Minister of War, Riza Pasha; Minister of Marine, Hassan Pasha; Minister of the Interior, Halil Rifat Pasha; Minister of Public Works, Commerce, and Agriculture, Suhdi Pasha; Minister of Justice, Hussein Riza Pasha; Minister of Finance, Nazif Effendi; Intendant of *Evkafs*, or property consecrated to the mosques and charitable uses, Galib Pasha; Minister of Education, Sihni Pasha. During the year Zuhdi Pasha became Minister of Education, and Tevfik Pasha, Minister of Public Works.

Citizens of Occidental countries are privileged throughout the Turkish Empire, under the capitulations, to be tried under their own laws by a tribunal presided over by their consuls in cases where Turkish subjects are not concerned, and where they are a dragoman of the consulate watches over the trial and sees that the sentence is duly executed if it goes against the Turk; if not, the consulate looks after its execution.

Finances.—The duties on liquors, salt, stamped paper, fishing, and silk raising, the tobacco monopoly, and tithes and customs duty on Persian tobacco, the Eastern Roumelian tribute, and the surplus taxes from the island of Cyprus are all pledged for the payment of the unified debt, which amounts to £92,225,827. The net receipts from these sources in 1890 were £1,942,562 Turkish (£1 Turkish = 100 piasters = \$4.50). Adding the Roumelian railroad, or Turkish lottery, debt, the total foreign debt amounts to £106,437,234 sterling.

Commerce.—The value of the total imports in 1890 was 2,291,434 piasters, and of the exports 1,283,647,000 piasters. Of the imports, 992,278,000 piasters were from Great Britain, 460,670,000 piasters from Austria-Hungary, 288,360,000 piasters from France, 170,304,000 piasters from Russia, and between 50,000,000 and 100,000,000 piasters from Bulgaria, Persia, and Belgium. Of the exports, 481,302,000 piasters went to Great Britain, 373,209,000 piasters to France, 103,945,000 piasters to Austria-Hungary, 68,565,000 piasters to Egypt, 55,421,000 piasters to Italy, and 51,206,000 piasters to Greece. The imports from the United States were 7,469,000 piasters, and the exports to the United States 18,263,000 piasters in value. The principal imports were: Linens for 207,700,000 piasters, sugar for 151,400,000 piasters, cereals for 130,500,000 piasters, piqué for 127,000,000 piasters, woollens and cottons for 115,900,000 piasters, cotton yarns for 113,100,000 piasters, and coffee for 88,700,000 piasters. The principal exports were: Cereals for 185,800,000 piasters, raw silk for 102,000,000 piasters, raisins for 98,600,000 piasters, opium for 70,300,000 piasters, coffee for 52,200,000 piasters, skins and

leather for 49,100,000 piasters, wool for 48,500,000 piasters, figs for 48,000,000 piasters, olive oil for 42,500,000 piasters, cocoons for 38,500,000 piasters, gall nuts for 36,200,000 piasters, and mohair for 35,500,000 piasters.

Communications.—The railroads open to traffic at the close of 1893 had a total length of 1,852 miles, of which 852 miles were in Europe and 920 miles in Asia Minor. A railroad from Jaffa to Jerusalem, built by a French company, was opened on Sept. 26, 1892. Another from Haifa to Damascus is being constructed with English capital. The concession for Anatolian railroads has been granted to Germans, who will extend the Angora line to Caesarea, and build lines between Smyrna, Konia, and Eskisher. In Europe, Ottoman companies, supported by French and German capital, are building lines between Salonica and Constantinople, and Salonica and Monastir. The Government is desirous of nationalizing all the European lines, and has entered into negotiations with the companies and the bondholders' commission.

The postal traffic in 1889 was 7,284,000 internal and 2,949,000 international letters, 119,000 cards, and 1,286,000 circulars and journals.

The telegraphs had a length of 20,140 miles, with 81,700 miles of wire, excluding 375 miles of cable. The receipts in 1889 were 51,615,526 piasters; expenses, 17,669,044 piasters.

The Army and Navy.—The peace strength of the army is reported as 280,000 men, though not more than 180,000 are effective. The war strength is reckoned at 800,000 men. The standing army is to be armed with Mauser rifles of 7-65 caliber.

The armored fleet in 1893 was made up of 3 casemated armor-clads, 2 floating batteries, 7 corvettes, 1 monitor, 1 gunboat, 2 river gunboats, 2 torpedo vessels, and 14 first-class and 7 second-class gunboats, having a total armament of 103 guns exceeding 10 centimetres and 216 of smaller caliber.

Political Trials of Armenians.—The Armenian National Committees, established in various capitals, are striving to secure political autonomy for their nation through the intervention of the powers. To rouse European public opinion and create sympathy for their national aspirations, it is necessary not only that private wrongs, administrative oppression, and miscarriages of justice should be committed against Armenians, but that their compatriots should make illegal demonstrations, which the Ottoman authorities are very anxious to repress, in order to avert the interference of the powers. In the early part of 1893 an outcry was raised in the province of Sivas against the Vali, Kosrev Pasha, and seditious speeches and placards gave occasion for arrests and incited lawless Kurds to acts of robbery and wanton violence in Caesarea, Mersivan, Yuzgat, and other places. Riots took place, in which both Armenians and Muslims were injured. The local authorities, pretending that the Armenians were conspiring to manufacture dynamite bombs and destroy property, arrested hundreds. Two professors in the evangelical seminary at Mersivan were arrested, and soon afterward the evangelical girls' school in Mersivan was burned by a Mohammedan mob. As both were American missionary

institutions, the United States minister sent an *attaché*, Harry R. Newberry, to inquire. He reported that the Armenian professors in the American college had introduced politics into their sermons.

The British Government, which has made the Armenian reforms enjoined by the Berlin Treaty its especial care, admonished the Porte to treat the Armenians with justice and humanity. Many of the prisoners had been condemned, and it was said that witnesses had been suborned and pretended confessions wrung from some of them by torture. The Porte ordered all the cases removed to Angora, the residence of the Vali, Abeddin Pasha, in whose intelligence and impartiality the Europeans had confidence, and who had therefore been constituted a special commissioner for Armenian affairs. The Porte agreed to pay full compensation to the American Missionary Society for the building that was burned. The British and the German Governments interceded for the two Protestant professors, Pastor Garabed Thumaian and Oancs Kayayan. Most of the prisoners were released on bail or on parole, and many were never tried. On June 12 the two teachers were condemned to death. The Vali urged the authorities at Constantinople to pardon them, as the sentence was excessive. There were 15 other persons who received the same sentence. On appeal, the sentences were confirmed, and 5 of the prisoners, who were convicted of common-law crimes, were executed. Thumaian and Kayavan were pardoned, but banished from Turkish dominions, and the sentences of all the rest who were found guilty of sedition were commuted, and most of them were deported to Arabia or Tripoli.

In August the Gregorian patriarch, Ashikian, who has several times threatened to resign when disputes have arisen between him and the Porte, while the Armenian agitators have constantly denounced him as a foe to their political aspirations, laid down his office because the Porte refused to summon the biennial National Assembly of 20 clergymen and 120 laymen for the election of the National Council of 12 clerical and 12 lay members which looks after the ecclesiastical and educational institutions, the administration of justice and the marriage laws, wills, inheritances, etc., in the Armenian Gregorian community, and advises the patriarch in ecclesiastical and national affairs. The Sultan, as usual, refused to accept his resignation. Khirmian, Archbishop of Jerusalem, was chosen Catholicos of the Armenian Church in May, 1892. The Turkish Government, which had formerly deposed him from the patriarchal see at Constantinople and deprived him of his rights as an Ottoman subject, detained him at Jerusalem, but finally, in June, 1893, allowed him to depart for Etchmiadzin.

Pacification of Arabia.—The Military Governor of Yemen, Ahmed Penzi Pasha, has thoroughly pacified that province, where an agitation against the caliphate, fostered by the Sultan's secret enemies in other parts of Turkey, brought on a general insurrection. He has also occupied the mountainous district of Saada, which has often served as a base for insurrectionary forces, not only in Yemen, but in the northern coast provinces of Assir and Hedjaz.

Wm. L. G. Hall

1871

On the west coast of Arabia the Porte has further strengthened its military position by garrisoning the island of Tiran and several points in the coast district of Midian.

TYNDALL, JOHN, a British scientist; born in Leighlin Bridge, Carlow, Ireland, on Aug. 21, 1830; died in Haslemere, Surrey, England, on Dec. 4, 1893. Although of English ancestry, for he traced his descent to William Tyndale, who was burned at the stake in 1536 for having translated the Bible into English, his immediate ancestors had settled in Ireland, whence they had come from Gloucestershire about two centuries ago. His father was in humble circumstances, and, after learning a trade, became connected with the Irish constabulary. He was a man of singular force of intellect and independence of character, and, although his education had been neglected, he taught himself on various subjects. Prof. Tyndall has said of him:

I had a father whose memory ought to be to me a stay and an example of unbending rectitude and purity of life. Socially low, but mentally high and independent, by his own inner energies and affinities he obtained a knowledge of history which would put mine to shame, while the whole of the controversy between Protestantism and Romanism was at his fingers' ends. Still this man, so charged with the ammunition of controversy, was so respected by his Catholic fellow-townsmen that they, one and all, put up their shutters when he died.

From this father the boy received his earliest instruction, and learned the Bible almost by heart. He attended the public schools until he was nineteen years of age, and was an excellent scholar, showing a special fondness for mathematics. But he had also an early interest in natural things, and his father flattered this tendency by calling him "Newton" and by teaching him lines concerning the great natural philosopher before he was seven years old that he never forgot. It is also said that the first germ of science that was dropped into his mind came to him from the father of Lord Kelvin (Sir William Thomson), who was then a teacher of mathematics in the Belfast Institution. It is also told how from reading the results of Sir Humphry Davy's experiments on radiant heat he determined to do something of that kind, and in after years, when he came to occupy the place filled by Davy at the Royal Institution, he did "do something of that kind."

In 1839 he entered the employ of the Ordnance Survey, then stationed at Leighlin. His chief was Gen. George Wynne, who enabled him to acquire a practical knowledge of every branch of the survey work, and he was in turn a draughtsman, a computer, a surveyor, and a trigonometrical observer. It was at this time that an incident occurred which had much to do with his subsequent career. One of the officials who had become interested in Tyndall's work asked him one day how his leisure was spent. The answer not being satisfactory, he rejoined: "You have five hours a day at your disposal, and this time ought to be devoted to systematic study. Had I, when at your age, had a friend to advise me, as I now advise you, instead of being in a subordinate position, I might have been at the head of the survey." Next morning Tyndall was at his books before 5 o'clock, and for twelve years never

swerved from the practice. The opportunities for advancement were few (for he said, "On quitting the Ordnance Survey in 1843 my salary was a little under twenty shillings a week"), and he determined to come to America, whither certain of his relatives had already made a home, but an opening was found for him as a railway engineer. He says of this period:

Then came a pause, and after it the mad time of the railway mania, when I was able to turn to account the knowledge I had gained upon the Ordnance Survey. In Staffordshire, Cheshire, Lancashire, Durham, and Yorkshire, more especially in the last, I was in the thick of the fray. It was a time of terrible toil. The day's work in the field usually began and ended with the day's light. In my own modest sphere I well remember the refreshment I occasionally derived from five minutes' sleep on a deal table, with "Babbage and Callet's Logarithms" under my head for a pillow. On a certain day, under grave penalties, certain levels had to be finished, and this particular day was one of agony to me. The atmosphere seemed filled with mocking demons, laughing at the vanity of my efforts to get the work done. My leveling staves were snapped, and my theodolite was overthrown by the storm. When things are at their worst a kind of anger often takes the place of fear. It was so in the present instance. I pushed doggedly on, and just at nightfall, when barely able to read the figures on my leveling staff, I planted my last "bench mark" on a tombstone in Haworth Churchyard. Close at hand was the vicarage of Mr. Brontë, where the genius was nursed which soon afterward burst forth and astonished the world.

When the railway work slackened he accepted an appointment as master in Queenwood College, Hampshire. It was here that he developed his remarkable capacity as a teacher. Such was his influence over the students that he was invariably called upon to quell their disturbances, which he did by moral influences and pure force of character. Here also he became associated with Edward Frankland, the distinguished chemist. He did not stay long, for, as he writes:

I did not put my money in a napkin, but cherished the design of spending it in study at a German university. I had heard of German science, while Carlyle's references to German philosophy and literature caused me to regard them as a kind of revelation from the gods. Accordingly, in the autumn of 1843, Frankland and I started for the land of universities, as Germany is often called.

To Marburg in Hesse Cassel the friends went. The university in this picturesque town was then famous largely on account of the chemical work by Bunsen, the Nestor of chemists, who still lives in Heidelberg. He tells his own story best:

I concentrated my chief attention upon mathematics, physics, and chemistry. Prof. Stegmann gave me the subject of my dissertation when I took my degree. Its title in English was "On a Screw Surface with Inclined Generatrix, and on the Conditions of Equilibrium on such Surfaces." I resolved that if I could not without the slightest aid accomplish the work from beginning to end, it should not be accomplished at all. Wandering among the pine woods and pondering the subject, I became more and more master of it; and when my dissertation was handed in to the philosophical faculty it did not contain a thought that was not my own.

He spent two years in Marburg, and there in conjunction with Prof. Knoblauch he made his first investigation in physics, which he published in the "Philosophical Magazine" in 1850 as "On the Magneto-optic Properties of Crystals, and

the Relation of Magnetism and Diamagnetism to Molecular Arrangement." His final studies were made under Magnus. He says:

To Berlin I went in the beginning of 1851. Prof. Magnus had made his name famous by physical researches of the highest importance. From him and from Clausius, Wiedemann, and Poggendorff I received every mark of kindness, and formed with some of them enduring friendships. Helmholtz was at this time in Königsberg. He had written his renowned essay on the "Conservation of Energy." In his own house I had the honor of an interview with Humboldt.

He returned to London in 1852, and in the same year was elected a fellow of the Royal Society. At the instigation of Dr. Bence Jones he was invited to give a Friday evening discourse at the Royal Institution in 1853 (Feb. 14), which proved so acceptable that almost im-

mediately, on the proposal of Faraday, he was appointed Professor of Natural Philosophy there in Faraday's place, thus succeeding to the chair formerly held by Davy. This place, together with that of Superintendent of the Royal Institution, he held until 1887, when he was succeeded by Lord Rayleigh. Of his relation to this institution a contemporary has written:

was proud of it, as, in spite of some physical drawbacks, he had a right to be. He delighted in a brilliant audience and in a brilliant lecturer, and spared no pains to bring the two together. He was *facile princeps* in the difficult art of presenting delicate scientific experiments to an audience. He rehearsed his effects as carefully as a stage manager those of the theater; and the lecture room of the Royal Institution was a theater. Nothing ever went wrong, nor missed fire. He took infinite pains to prevent any scientific or experimental miscarriage. People who cared nothing for science came to hear him because he spoke so well, and to see the performances because the performances were so good.

Huxley, his distinguished contemporary, who knew him long and well, first met him in 1851. He says of him:

"I found my new friend a difficult subject in

certain sedis, as the naturalists say—in other words, hard to get into any of my pigeonholes.

Before one knew him well it seemed possible to give an exhaustive definition of him in a string of epigrammatic antitheses, such as those in which the older historians delight to sum up the character of a king or leading statesman. Impulsive vehemence was associated with a singular power of self-control and a deep-seated reserve not easily penetrated. Free-handed generosity lay side by side with much tenacity of insistence on any right, small or great; intense self-respect and a somewhat stern independence with a sympathetic geniality of manner, especially toward children, with whom Tyndall was always a great favorite. Flights of imaginative rhetoric,

which amused (and sometimes amazed) more phlegmatic people, proceeded from a singularly clear and hard-headed reasoner, overscrupulous, if that may be, about keeping within the strictest limits of logical demonstration, and sincere to the core. A bright and even playful companion, Tyndall had little of that quick appreciation of the humorous side of things in general and of one's self in particular which is as oil to the waves of life, and is a chief component of the worthier kind of tact; indeed, the best reward of the utterer of a small witticism or play upon words in his presence was the blank if benevolent perplexity with which he received it. And I suppose the character sketch would be incomplete without an explanation of its peculiarities by a reference to the mixture of two sets of hereditary tendencies, the one eminently Hibernian and the other derived from the stock of the English Bible translator and reformer." The researches on magnetism begun in Marburg were promptly renewed, and for several years after his acceptance of the post at the Royal Institution he was occupied in studying the question of diamagnetic or reversed polarity, the existence of which had been disputed and denied

TYNDALL'S HOUSE.

It may almost be said that during that period he was the Royal Institution. It was then that the most brilliant and not the least practical and useful part of its scientific work was done. Tyndall was an ideal director. He was a first-rate man of science. His place in pure science was one of the very highest, but there were, and are, many men very eminent in pure science who would have been very unfit directors of the Royal Institution.

The establishment in Albemarle Street is a half-way house between science and society. It performs a great deal of scientific work of high value quite independently of other than scientific influences. But it appeals to the public. It gives courses of lectures on a great variety of subjects. Its Friday evenings were at one time a favorite resort of one of the several sets of London society, the most cultivated set, and it was Tyndall who made them so.

You could not get him [Tyndall] to admit that anything was wrong with his darling institution. He

by Faraday. His results were subsequently incorporated in a volume entitled "Researches on Diamagnetism and Magneto-Crystalline Action" (1870). In 1859 he began that series of brilliant researches on radiant heat which extended over ten years, resulting in the publication, in 1872, of "Contributions to Molecular Physics in the Domain of Radiant Heat," which, however, was preceded by "Heat as a Mode of Motion" (1863), in which he developed the modern view of the nature of heat which involves a molecular conception of the bodies displaying it. In 1865 he delivered the Rede lecture on "Radiation." He devoted also much attention to the subjects of sound and light, lecturing on both of these topics. His "Heat as a Mode of Motion" was promptly accepted as a classic, and is one of the best popular works ever written on a scientific subject. He followed it with the volume on "Sound, a Course of Eight Lectures," in 1865, and "Notes of a Course of Nine Lectures on Light" in 1870. Concerning these works, it has been well said that "they bring out with magnificent power not only the methods of science, but the grandeur and impressiveness of what may be called its imaginative aspects."

Meanwhile, in 1866 he was called upon to relieve Faraday in his duties in the Trinity House, serving as scientific adviser to the authorities there, especially in connection with inquiries made into the causes which effect the acoustic transparency of the atmosphere. He also held advisory relations to the London Board of Trade, but resigned these appointments in 1883, owing to a disagreement with Joseph Chamberlain, then president of that board.

In 1846 he spent some time among the Westmoreland hills, and three years later made his first visit to the Alps. He was then in need of rest and recreation, but in the presence of the grand physical phenomena displayed there he became interested in the scientific questions which they aroused in his mind. A second visit was made in 1856 in company with Huxley, who writes: "The love for alpine scenery and alpine climbing, which remained with Tyndall to the last, began, or at any rate became intensified into a passion, with this journey, and at the same time he laid the foundations of his well-known and highly important work on glaciers and glacier movement." No year from that time forward passed without a summer visit to his *chalet* at Bel Alp, overlooking the Aletsch Glacier. His investigations of his trip in 1856 were presented to the Royal Society as a joint contribution from the two friends. In 1859 he reached Montanvert and determined the winter motion of the Mer de Glace. In conjunction with Frankland he planted several thermometric stations on the slopes and summit of Mont Blanc and made numerous observations relating to combustion at great altitudes. He scaled the hitherto inaccessible peak of the Weisshorn in 1861, and in 1868 he reached the summit of the Matterhorn, crossing it from Breuil to Zermatt. His writings on these mountains, together with results of his researches, are included in "The Glaciers of the Alps" (1860), which was his first popular book on science; "Mountaineering in 1861" (1862); "Hours of Exercise in the Alps" (1871); and "The Forms of Water in Clouds and Rivers, Ice and Glaciers"

(1872), which formed the initial volume of the "International Scientific Series."

As previously stated, Tyndall had almost decided to settle in the United States in 1844, when an opportune engagement called him elsewhere, and in 1852 he was an unsuccessful candidate for the chair of Physics in the University of Toronto, in Canada, but it was not until twenty years later that he accepted an invitation to deliver a course in the Lowell Lectures in Boston. He arrived in New York in October, 1872, and after lecturing in Boston delivered courses in Philadelphia, Baltimore, Washington, New York, Brooklyn, and New Haven. From these lectures, after deducting his expenses, there remained the net sum of \$13,038, which amount he placed in the hands of three trustees with instructions to use the interest "for the support of two American pupils who may evince decided talents in physics, and who may express a determination to devote their lives to this work. My desire would be that each pupil should spend four years at a German university, three of those to be devoted to the acquisition of knowledge, and the fourth to original investigation." This failed to yield the desired results, and in 1886, the original fund having increased to \$32,400, it was decided to divide this sum into three equal amounts, to be given, one to Columbia College, one to Harvard University, and one to the University of Pennsylvania, for the founding of three permanent fellowships in physical science. Tyndall decided on this action before coming to the United States. He wrote, in June, 1871: "I don't want your money, nor will I bring away one dollar of it. I will help your scientific institutions with it; but it shall not be said that I went to America to line my pockets."

It was also during 1872 that in an issue of the "Contemporary Review" he published a letter addressed to himself in which the writer proposed to have set aside in a hospital a ward for patients who should be prayed for. In the other wards were to be placed patients who were not prayed for. All were to receive the same treatment, and the result was to be noted and accepted as a test of the efficacy of prayer in curing diseases or ailments. The proposition was declined, but not until considerable acrimonious controversy had taken place over what was called "Tyndall's prayer-test."

In August, 1874, the British Association met in Belfast with Tyndall as its president. His inaugural address was a most masterly effort, and was written in a style of remarkable grace and vigor. It traced the sources of natural phenomena from the atom upward, culminating in "the confession that I feel bound to make before you is that I prolong the vision backward across the boundary of the experimental evidence and discern in that matter, which we in our ignorance, and notwithstanding our professed reverence for the Creator, have hitherto covered with opprobrium, the promise and potency of every form and quality of life." The address closed with the sentiment; "Here, however, I must quit a theme too great for me to handle, but which will be handled by the loftiest minds ages after you and I, like streaks of morning cloud, shall have melted into the infinite azure

of the past." These bold words, so distinctly expressive of a belief in the advanced views of evolution as taught by Darwin, Huxley, and Spencer, were not allowed to pass unnoticed. Many of the ablest English writers hastened to reply to the address, and a long and bitter controversy ensued. But this only strengthened the statement of Tyndall's views, as he himself has best shown in the "Reply to the Critics of the Belfast Address," issued in 1875, as a preface to a seventh edition of the "Address." But

presided. In his speech of acknowledgment he said: "In 1850, during a flying visit from Germany to England, I stood for the first time in the bright presence of Faraday. In February,

TYNDALL'S STUDY.

so free an expression of "advanced views" was not without certain disadvantages, and later he wrote: "Few persons at the present day have more distinctly avowed belief in the 'potency of matter,' and few have paid more dearly for that avowal than myself." Indirectly from this controversy came an expression of a belief in spontaneous generation by some writers, followed by a distinct denial of such a possibility by others. Tyndall at first leaned to the positive side of this question, and promptly instituted a series of experiments that yielded negative results. His contributions to this subject were collected as "Essays on the Floating Matter of the Air in Relation to Putrefaction and Infection" (1881). (See "Germ Theory and Spontaneous Generation," in the "Annual Cyclopædia" for 1878, page 387.)

Among his other works are the following: "Faraday as a Discoverer" (1868); "Natural Philosophy in Easy Lessons" (1869); "On the Scientific Use of the Imagination" (1870); "Fragments of Science for Unscientific People" (1871); and "New Fragments" (1892). His scientific honors were many. The Royal Society gave him its Rumford medal for his researches in thermodynamics. Cambridge gave him the degree of LL. D. in 1855, and Edinburgh similarly honored him in 1866, while Oxford bestowed her D. C. L. upon him in 1873.

In 1887 he retired from the Royal Institution, and at that time was honored with a banquet over which the President of the Royal Society

1858, I gave my first Friday evening lecture in the Royal Institution, and three months afterward, on the motion of Faraday, the old chair of Natural Philosophy, which had been filled at the beginning of the century by Thomas Young, was restored, and to it I was elected."

Subsequently, with the exceptions of his visits to the *chalet* in the Alps, the remaining years of his life were spent at his home, in Haslemere, Surrey, tenderly cared for by his wife, Lady Louise Charlotte Hamilton, whom he married in 1876. She became his assistant and acted as his secretary and amanuensis. It was during these last years that he so violently expressed his disapprobation of Gladstone's home-rule policy, and in terms so bitter that they were even offensive to some of Gladstone's most resolute opponents. He was a sufferer from insomnia and rheumatism, and these may, perhaps, have been the cause of his bitterness. His death was the result of an accident caused by an overdose of morphine given him by his wife, of whom Huxley so pleasantly writes: Her "whole life had been, for many years, devoted to the one object of preserving that of her husband." More than twenty years ago the greatest of living physicists, Helmholtz, of Berlin, said of Tyndall: "The greater part of his activity has always been given to scientific investigation, and we owe to him a series of highly original and remarkable researches and discoveries in physics and physical chemistry." Such was the opinion of the greatest of one only a little less great.

U

UNITARIANS. The "Yearbook of the Unitarian Congregational Churches" for 1894 gives lists of 459 Unitarian societies and 517 ministers in the United States and Canada. The chief representative meeting of these churches is the National Conference of Unitarian and Other Christian Churches, which meets biennially. Contributing churches are also represented in the American Unitarian Association, the purposes of which are to collect and diffuse information respecting the state of Unitarian Christianity in our country; to promote union, sympathy, and co-operation among liberal Christians; to publish and distribute doctrines and tracts inculcating the views of religion regarded by Unitarians as correct, in such form and at such price as shall make them acceptable and obtainable; to supply missionaries; and to assist in building churches and supplementing insufficient salaries of clergymen. The association consists of life members—made so by contributing \$50; delegate members, representing churches which make contributions of funds for missionary uses; and honorary members, who are chosen by the Board of Directors, and have the same rights and privileges as other members. More than 260 societies, contributing to the missionary funds of the association, are entitled to representation in its meetings by their ministers or presidents and 2 lay delegates each. The annual meeting of the association was held in Boston, Mass., May 30. The Hon. G. S. Hale presided. The reports of the directors and the treasurer were read. The association was shown to possess \$548,845 of funds, assets, and property, invested or otherwise, and to be the patron of five schools and academies. Addresses were made on "The Work done in the Unitarian Churches on the East Slope of the Rocky Mountains and on the Pacific Coast," by the Rev. J. W. Chadwick; "The Unitarian and Liberal Churches of Japan," by the Rev. Clay MacCauley; "The Rocky Mountain Conference," by the Rev. Samuel Eliot; "The Prospects of Unitarianism in the East and West," by the Rev. Joseph Waite; "Unitarianism in the South," by the Rev. C. J. K. Jones; "The Position, Prospects, and Needs of Liberal Religion in the West," by John E. Roberts; "The Effect of the Civil War on the Religious Life of America," by the Rev. E. E. Hale, D. D., Rev. G. A. Thayer, Col. T. W. Higginson, and the Rev. Robert Collyer, D. D. Pertinently to the address of Mr. MacCauley conveying the greetings of the Unitarians of Japan, a resolution was passed expressing confidence in the adaptability of the principles and spirit of liberal Christianity to the nature and needs of all mankind, and commending the Japanese mission. President Hale, speaking in his address of the growth during the past six years of active social organizations for religious or partly religious purposes, affirmed that the Unitarian denomination was early in the movement which has spread among others, in such organizations as the Helping Hands, the guilds, the Societies of Christian

Endeavor, the Henry Wadsworth organizations, etc. The other principal general society of Unitarians is the Sunday-School Society, which holds a special meeting in Boston in "Anniversary Week," and an annual meeting in the fall for business, the election of officers, and discussion of Sunday-school work. The annual meeting for 1893 was held in West Newton, Mass., Oct. 25. The treasurer reported a small balance in the treasury. The National Alliance of Unitarian and other Liberal Christian Women is an organization the purpose of which is to enable the women of the denomination to work more efficiently for the advancement of liberal religion. The Ministers' Institute was organized under the auspices of the Council of the National Conference. It meets biennially, in alternation with the meetings of the National Conference. The Ministerial Union has provided a lending library for the use of members in the building of the American Unitarian Association, Boston. Besides these societies, the denomination has theological schools at Cambridge, Mass., and Meadville, Pa., academies at Greenfield, Mass., Andover, N. H., and West Bridgewater, Mass.

Unitarianism is represented in England by the British and Foreign Unitarian Association, founded in 1825, and the National Conference, which was established in 1882, and meets every three years. Three theological schools are maintained, viz., Manchester College, Oxford, Warrington Academy, and the Home Missionary College, Manchester. In Hungary the Unitarians have more than 100 churches, with 50 or more "filial" or "daughter churches," and about 60,000 registered members. The governing authorities are an ecclesiastical council of 350 members, with Bishop Joseph Ferencz and 8 rural deans. The higher education is provided for by the college at Klausenburg, besides which there are middle schools at Thorda and Szeckely-Keresztur. Several native churches have been formed in Japan; and a "Unitarian Review" is published in the native tongue.

UNITED BRETHREN CHURCH. This Church suffered a division in 1889, when the General Conference adopted a revision of the Confession of Faith and a new constitution in which were incorporated a provision for the admission of laymen to the General Conference and a modification of the rule prohibiting membership in secret societies. A minority, with one of the bishops, held that these statutes were adopted in an illegal manner, and, withdrawing from the General Conference, organized what they claimed was the legal General Conference. The division extended till it involved many of the annual conferences, and there are now two sets having the same names and territory. The general property and the offices and most of the churches and parsonages remain in the hands of the majority branch, or the "Liberals," as they are currently called. Suits have been instituted in several States for the possession of church property, and have been variously de-

cided by local and State courts, but no final decision has yet been reached. The census of the United States for 1890 gives the Liberal branch 45 annual conferences and 3,731 church organizations in 23 States, with 202,474 communicant members and \$4,292,643 of property; and the Conservative branch, or United Brethren of the old constitution—sometimes, too, called Radicals—765 organizations in 12 States, with 22,870 communicants and \$644,940 of property.

I. Liberal Branch.—The twenty-first General Conference met in Dayton, Ohio, May 11. For the first time in the history of the Church lay delegates were present as members of the Conference, in the proportion of 56 to 181 clerical delegates, and 2 of them were women. Allusion was made to these new features in the quadrennial address of the bishops. The address continued with a review of the condition of the Church as it had been affected by the separation, eight years before. It said:

Statistics exhibit our present membership at 204,982. The membership decreased in number from 207,800, as shown in the bishop's address to the last General Conference, to 197,123, as shown by the statistics of the year 1890. This was the lowest point reached as a result of the defection from the Church, which began during the sitting of the last General Conference. It showed a decrease of 10,677. Since then the membership of the Church has been steadily on the increase. The results of the ingathering of the past winter are not, in most of the conferences, included in these statistics, so that it is safe to say the present membership is about the same in number as reported to the York General Conference. Considering the circumstances through which the Church has passed, this statement furnishes occasion for devout thanks to God.

The number of churches had increased since the last General Conference from 2,609, valued at \$3,757,161, to 2,976, valued at \$4,430,445; besides which there were 564 parsonages, valued at \$502,616. The total contributions of the last year had been \$1,183,030, a gain over the contributions of 1888 of \$146,944, or 80 cents per member. The Missionary Society returned the number of foreign missionaries as 32; of missionaries in mission conferences and districts, 118; and of missionaries in home conferences, 225; making in all 375 missionaries. The Church had 777 members in Germany and 5,978 in Africa. The Woman's Missionary Society had raised more than \$50,000 during the four years, and not less than \$142,383 since its organization, eighteen years before. The cash receipts of the Publishing House for the quadrennium had been \$713,052; the profits had been \$82,490; and the total assets were \$359,576. Forty thousand one hundred and twenty-five dollars had been collected for Church extension, and 66 churches had been aided. The 3,493 Sunday schools had a total enrollment of 262,000, or 55,000 more than the number of church members.

The Young People's Christian Union was approved and recognized and made a distinct department of the work of the Church, and provision was made for the establishment of a newspaper organ devoted to its interests. The office of church-erection secretary was established. It was decided that one half of all the funds collected for missionary purposes, except in the Ohio German Conference, should be paid

into the general missionary treasury, provided that the Board of Missions may return to such conferences as may need more funds to carry on home work such appropriations as it may deem wise; and the conference pledged itself to raise \$100,000 for missions during the coming year. It was ordered that in the election of delegates to the General Conference three times as many candidates as there are delegates to be elected, of either order, shall be nominated by the ministers and by the lay delegates in the annual conferences, respectively, and that from these the delegates shall be chosen by the people. The "time limit" was removed from the pastoral term. Under the rule adopted, pastors will be appointed for a year at a time, but will be subject to reappointment for an unlimited number of years. A rule was adopted forbidding ministers to act in the capacity of traveling evangelists without being appointed to such work by the annual conferences to which they may belong. Bishops N. Castle, D. D., E. B. Kephart, D. D., L. L. D., and J. W. Hott, D. D., were re-elected bishops for another term of four years. The Rev. George A. Funkhouser, D. D., was elected a fourth bishop, but declined to leave his professorship in Union Biblical Seminary to accept the office, and Prof. J. S. Mills, D. D., Ph. D., of Western College, was chosen to the position. Bishop J. Weaver, D. D., who had been in the bishop's office twenty-eight years, was elected *emeritus* bishop; Bishop J. Dickson, D. D., who had been a bishop twenty-four years, and was seventy-three years of age, was not re-elected, but received a testimonial from the conference. Resolutions were adopted declaring total abstinence from all intoxicating drinks to be the duty of every individual; that the liquor traffic is only evil; that high-license laws are utterly at variance with the divine method of treating crime; that no political party has a right to expect, or should receive, the support of Christian citizens so long as it stands committed to the license policy or refuses to put itself in an attitude of open hostility to the saloon; approving an official national recognition of the Christian religion; inviting the application of gospel principles to the labor question; deploring the prevalent tendency to Sabbath breaking and urging the enforcement of laws against Sabbath desecration; insisting on the maintenance of the public-school system with teaching in the English language and opposing the appropriation of public money for sectarian schools; and declaring only such amusements proper to the Christian "as will tend to recreate him physically, mentally, and morally, and that whatever will interfere with his highest growth in any of these lines should not be indulged in."

The Board of Missions, at its meeting after the General Conference, made appropriations to the African Mission of \$7,660; to the mission in Germany of \$2,200; and to the Freedmen's Mission of \$250. Other appropriations to conference and home missions made it \$20,737.

The receipts of the Woman's Board of Missions for the year were \$23,836, and its expenditures \$16,280. It supports, in connection with the home work, a Chinese school with 7 teachers, 45 enrolled pupils, and an average attendance of 18, having property that has increased in value

to double its original cost; and returns in its American, Chinese, and African work 12 American missionaries, 26 native itinerants, 154 appointments, 1,679 members and seekers, and property valued at \$38,000.

The statistical report of Union Biblical Seminary represents its properties, clear of all liabilities, as amounting to \$162,773, and shows a gain of \$34,397 in four years.

II. United Brethren Church (Old Constitution).—The General Conference of the Conservative branch met in Indiana in May, and legislated concerning the organization of the boards and benevolences of the Church. The entire educational interests of the Church were put under the care of a general Board of Education, with power to locate and provide for the management and support of such educational institutions as the Church might need. Bishops Milton Wright, H. T. Barnaby, and Halleck Floyd were re-elected bishops for the East, and the Rev. William Dillon, D. D., was elected bishop for the Pacific coast.

UNITED STATES OF AMERICA, a federal republic in North America. The Federal Government has for its executive head a President, elected for four years by the majority vote of electoral colleges, whose members, proportioned among the States according to their representation, are elected directly by the people of each State. The legislative power is vested in a Congress of two Houses—a Senate containing 2 representatives from each State, elected by their Legislatures, and a House of Representatives, whose members are elected by districts in the proportion, under the apportionment based on the census of 1890, of 1 to 173,901 of population. The powers of Congress and the Executive are restricted to matters specified in the Federal Constitution.

The Administration.—Grover Cleveland, having been elected in November, 1892, to succeed President Harrison, was on March 4, 1893, inaugurated President of the United States. In his inaugural address the President urged the necessity of maintaining a sound and stable currency, and pledged the Executive branch of the Government to use all its power to uphold the national credit and avert financial disaster. He further pledged the Administration to use every effort to carry out the behest of the people, who demanded the reform of the tariff, and declared that the necessity for revenue to support the Government furnishes the only justification for taxing the people. He condemned the disposition to expect from the operation of the Government direct individual advantages, and declared that paternalism should have no place in a republican government. He also condemned bounties and subsidies and reckless pension expenditure. Adlai E. Stevenson, who had been elected Vice-President, took the oath of office and assumed the presidency of the Senate, in succession to Levi P. Morton. The President appointed the following Cabinet, which was confirmed by the Senate: Secretary of State, Walter Q. Gresham, of Illinois; Secretary of the Treasury, John G. Carlisle, of Kentucky; Secretary of War, Daniel S. Lamont, of New York; Attorney-General, Richard Olney, of Massachusetts; Postmaster-General, Wilson S. Bissell, of

New York; Secretary of the Navy, Hilary A. Herbert, of Alabama; Secretary of the Interior, Hoke Smith, of Georgia; Secretary of Agriculture, J. S. Morton, of Nebraska. The following are the principal important departmental appointments made by President Cleveland: Assistant Secretary of State, Edwin F. Uhl, Michigan; Third Assistant Secretary, Edward H. Strobel, New York; Assistant Secretaries of the Treasury, William Edmund Curtis, New York, Charles S. Hamlin, Massachusetts, and Scott Wike, Illinois; First Comptroller, Robert B. Bowler, Ohio; Commissioner of Customs, William H. Pugh, Ohio; First Auditor, Ernest P. Baldwin, Maryland; Treasurer of the United States, Daniel N. Morgan, Connecticut; Register of the Treasury, J. Fount Tillman, Tennessee; Comptroller of the Currency, James H. Eckels, Illinois; Commissioner of Internal Revenue, Joseph S. Miller, West Virginia; Commissioner of Navigation, Eugene T. Chamberlain, New York; Solicitor of Internal Revenue, Robert T. Howe, Ohio; Director of the Mint, Robert E. Preston, District of Columbia; Chief of the Bureau of Statistics, Worthington C. Ford, New York; Chief of the Bureau of Engraving and Printing, Claude M. Johnson, Kentucky; Supervising Architect, John O'Rourke, New Jersey; Solicitor of the Treasury, Felix A. Reeve, Tennessee; Assistant Secretary of War, Joseph B. Doe, Wisconsin; Assistant Secretary of the Navy, William McAdoo, Virginia; First Assistant Postmaster-General, Frank H. Jones, Illinois; Third Assistant Postmaster-General, Kerr Craigie, North Carolina; Fourth Assistant Postmaster-General, Robert A. Maxwell, New York; Solicitor-General to the Department of Justice, Laurence Maxwell, Ohio; Assistant Attorneys-General, Holmes Conrad, Virginia, Joshua E. Dodge, Wisconsin, John I. Hall, Georgia, Charles B. Howry, Mississippi, William A. Maury, District of Columbia, John L. Thomas, Missouri, and Edward B. Whitney, New York; First Assistant Secretary of the Interior, William H. Sims, Mississippi; Assistant Secretary, John M. Reynolds, Pennsylvania; Commissioner of the General Land Office, Silas W. Lamoreaux, Wisconsin; Commissioner of Pensions, William Lochren, Minnesota; Commissioner of Indian Affairs, Daniel M. Browning, Illinois; Commissioner of Patents, John S. Seymour, Connecticut; Commissioner of Railroads, Wade Hampton, South Carolina; Assistant Secretary of Agriculture, Charles W. Dabney, Jr., of Tennessee; Superintendent of Immigration, Herman Stump, Washington; Commissioner at New York, Joseph H. Senner; Collector of Customs at the port of New York, James T. Kilbreth.

WALTER QUINTIN GRESHAM was born March 17, 1832, near Lanesville, Harrison County, Ind., and is of an old English family. His father, William Gresham, who was sheriff of the county, was shot while arresting a desperado, and his widowed mother was left with five small children, of whom Walter was next to the youngest, he being only two years old at the time. Mrs. Gresham was poor but very energetic, and she managed the farm and kept the family together. During his boyhood Walter followed the plow by day and studied at night, gaining his education through hard work and self-denial. He went to the district school in the winter season, and when he was sixteen obtained a clerkship in the

county auditor's office, which enabled him to pay his expenses at Corydon Seminary. After two years there he spent a year at Bloomington University, and on his return obtained a place in the county clerk's office at Corydon. Here he studied law in the office of Judge William A. Porter, and at the age of twenty-two was admitted to the bar and began practice. In politics he had been a Whig from boyhood, and he joined the Republican party upon its organization, stamping the State for Gen. Fremont in 1856. Mr. Gresham was elected to the State Legislature in 1860, and as chairman of the Committee on Military Affairs secured the passage of a bill which placed Indiana almost on a war footing. When the war broke out he declined a re-nomination for the Legislature and enlisted as a private in the Thirty-eighth Indiana Volunteers, and was soon made lieutenant-colonel of the regiment. His first active service in the war was at Shiloh, his next at Corinth, and at Vicksburg he met Gen. Grant. After the surrender Grant and Sherman united in recommending him for a brigadier's commission, which he received. While in command of a division of Sherman's army before Atlanta, Gen. Gresham was shot in the knee, and he has never fully recovered the use of his shattered leg. In 1865 he was brevetted major-general, and on being mustered out began the practice of law in New Albany, Ind. He was offered by President Grant the collectorship of the port of New Orleans, and subsequently the office of District Attorney for Indiana, but declined both offers. He was twice nominated for Congress, but was defeated. In 1869 President Grant tendered him the appointment of United States District Judge for Indiana, which he accepted, and during the twelve years of his judgeship there not one of his decisions was reversed. In 1880 he was a candidate for United States Senator, but was defeated by Benjamin Harrison. President Arthur called Judge Gresham to his Cabinet in 1883, giving him the portfolio of Postmaster-General, and later he succeeded Judge Folger as Secretary of the Treasury. He shared the President's views regarding a revision of the tariff and the reduction of the surplus revenue. He resigned his place in the Cabinet to become United States Judge of the Seventh Judicial District, holding court at Chicago, which place he held for many years, and his deci-

WALTER QUINTEN GRESHAM.

sions have been regarded as models of fairness and legal accuracy. He was a candidate for the Republican nomination for President in 1884, and again in 1888, and refused a nomination from the People's party in 1892. In that year he voted for Mr. Cleveland, giving his reasons in a letter written during the campaign.

JOHN GRIFFIN CARLISLE was born in Campbell (now Kenton) County, Ky., Sept. 5, 1835, and was the youngest son of a large family. He received a

JOHN GRIFFIN CARLISLE.

common-school education, studied law with Senator John W. Stevenson, taught school for a time in Covington, and was admitted to the bar in 1858. He soon came to be regarded as a lawyer of ability, and his practice eventually grew to be one of the largest in Kentucky. In 1859 he was elected to the lower house of the State Legislature. In 1866 he was elected State Senator, and in 1869 was re-elected. From 1871 to 1875 he was Lieutenant-Governor of Kentucky. In 1876 he was elected to Congress, and was continually returned until he succeeded the late Senator Beck in the United States Senate, in 1890. He was chosen Speaker of the House in 1883, and also in 1885 and 1887. He was clear-headed and even-tempered, and none of his rulings were ever reversed by the House. During the Forty-sixth Congress his internal-revenue bill made him the recognized leader of his party on the question of taxation; and in all the succeeding tariff debates he has led his party, both in and out of Congress. Mr. Carlisle is a student, and finds little time for the social side of official life. Mrs. Carlisle comes of an old and well-known Kentucky family, her father being John A. Goodson, first Mayor of Covington. She is a woman of refinement and great decision of character.

HILARY A. HERRERT was born in Laurensville, S. C., in 1838, and while a child was taken by his father to Alabama. He was educated at the University of Alabama and the University of Virginia, and after studying law was admitted to the bar. Upon the breaking out of the war he entered the service of the Confederacy as a captain, and was afterward promoted and became colonel of the Eighth Alabama Volunteers. He was disabled at the battle of the Wilderness, and after the war resumed the practice of law at Greenville, Ala. In 1872 he removed to Montgomery, where he has since practiced. He was elected to the Forty-fifth Congress, and has been returned to every Congress since that time up to and including the Fifty-second. As chairman of the Committee on Naval Affairs he showed decided ability and carried his bills through with little delay. He has during his entire congressional career favored reform in the tariff, and has made many speeches thereon; and he has also supported all measures of civil-service reform. He is opposed to the free coinage of silver, and has often spoken

against it, both in and out of Congress. He has a thorough acquaintance in detail with the affairs of the Navy Department. He has a pleasing personality, and is an effective speaker. In Congress he was known as an energetic worker, very persistent in

HILARY A. HERBERT.

carrying his point, while treating his opponents with courtesy. Mr. Herbert is a widower, with three children, and is fond of society.

DANIEL SCOTT LAMONT was born in Cortlandville, N. Y., Feb. 9, 1851, and is of Scottish ancestry. His father, John B. Lamont, and mother, Elizabeth Scott Lamont, live in McGrawville, Cortland County, N. Y., where the senior Lamont has been a merchant for upward of thirty years. Daniel was educated in the

DANIEL SCOTT LAMONT.

common schools and the McGrawville Academy, and during this time also worked in his father's store. In 1868 he entered the class of 1872 in Union College. He was appointed deputy clerk of the Assembly in

1871, and during the time he held the place made an extensive acquaintance with the public men of the State. He was a delegate from Cortland County to the Democratic State Convention in 1871, and cast his vote with Samuel J. Tilden in his fight against Tweed and Tammany Hall. Mr. Lamont was nominated in 1878 for clerk of Cortland County, and as, though defeated, he ran ahead of his ticket, he was nominated the next year for Assembly, and was defeated by a small majority. At the request of Gov. Tilden he was made deputy clerk of the Assembly. His relations with the Governor were intimate, and he practically managed Mr. Tilden's campaign against the canal ring. In 1876-77 he served as Chief Clerk of the State Department at Albany, and in January, 1878, bought an interest in the Albany "Argus," and thus became associated with Daniel Manning. In 1882 he retired from the "Argus" to become private secretary to Gov. Cleveland. He was also private secretary to Mr. Cleveland during his first presidential term, and at the end of the term he associated himself with Secretary Whitney and Col. Payne in their enterprises in the city of New York, and undertook the acquirement and consolidation of the street railways and the formation therefrom of the Metropolitan Traction Company, which enterprise was successfully carried out and resulted in a large profit to the promoters and stockholders. In 1874 he married Miss Julia Kinney, of Cortland County, and they have three children.

RICHARD OLNEY was born in Oxford, Mass., Sept. 16, 1835, and his ancestors were among the early Baptists of New England. He was graduated at Brown

RICHARD OLNEY.

University in 1856, studied at Harvard Law School, and entered the law office of Judge Benjamin F. Thomas, in Boston, in 1859. He advanced rapidly in his profession, and was for many years counsel for the Eastern Railroad Company, and after the consolidation was retained as counsel for the Boston and Maine, which place he held when appointed Attorney-General. He was also chief counsel for other railroads. The income from his practice was probably larger than that of any other lawyer in New England. Mr. Olney is known in Boston as an old-line Democrat, but not as an active politician, the only public office ever held by him being that of member of the lower house of the Massachusetts Legislature, in 1874. He has repeatedly declined to allow himself to be nominated for office, and has twice refused a place on the Supreme bench of the State. He once was a candidate for Attorney-General of Massachusetts, but was defeated. He is a

forcible speaker, a fine classical scholar, and of high standing socially. He has a wife and two daughters, both of whom are married.

WILSON SHANNON BISSELL was born in Rome, N. Y., Dec. 31, 1847, and removed with his parents to Buffalo, N. Y., when about six years old. His father, John Bissell, was for many years a forwarding merchant in Buffalo, and his brother, Arthur D., was appointed collector of that port during Mr. Cleveland's first administration. Shannon attended the public schools in Buffalo and Hopkins Grammar School in New Haven, and was graduated at Yale College in 1869. He then studied law in the office of A. P. Lanning, in Buffalo, and in 1872, having been admitted to the bar, became the partner of Lyman K. Bass. In 1874 Mr. Cleveland joined the firm, which became Bass, Cleveland & Bissell. Mr. Bissell has been active in politics since his chief received the nomination for Governor, and has always remained his close personal and political friend. He declined to accept office during President Cleveland's first term, pre-

Cleveland's nomination, and succeeded in giving him the solid vote of the Georgia delegation. Mr. Smith is regarded as one of the ablest lawyers in the South,

HOKE SMITH.

and derives a large income from his practice. He is the controlling owner of the Atlanta "Journal," a Cleveland and tariff reform organ, and at the time of his appointment as Secretary of the Interior had been for two years President of the Atlanta Board of Education.

JULIUS STERLING MORTON was born in Adams, Jefferson County, N. Y., April 22, 1832. His parents removed during his infancy to Ann Arbor, Mich., where he attended the public schools. He returned with his parents to his native State, and graduated at Union College. Soon after, and at the age of twenty-two, he married Miss Caroline Joy French, and the young couple settled in Bellevue, Neb. They sub-

WILSON SHANNON BISSELL.

ferring, as he said, to be a friend of the Administration on the outside. Mr. Bissell is an able railroad lawyer, and his present firm enjoys a large practice. He married in 1890 Miss Louisa Fowler Sturges, of Geneva, N. Y., and they have one child.

HOKE SMITH comes of a Revolutionary family from New Hampshire. His great grandfather was an officer in Gen. Washington's army, and his grandfather was one of the shrewdest politicians of New Hampshire. Hoke Smith's father went South to take a professorship in the University of North Carolina, and there met and married a sister of Gen. Hoke. Hoke Smith was born in 1855, was given a good education, and went to Georgia at the age of sixteen. There he began teaching, and in his leisure hours studied law. After his admission to the bar his ability was quickly recognized, and he soon had a good practice, being retained by railroad companies and municipal bodies to conduct intricate negotiations. He entered politics when twenty years old, and soon after was made chairman of the Democratic Executive Committee of Atlanta. He was chairman of the State convention that nominated Gov. Northen, and from that time has been recognized as the tariff-reform leader of the State. He first met President Cleveland during the Piedmont Exposition in 1889, and formed a strong personal attachment for him, and afterward they were in frequent correspondence. At the Democratic National Convention in 1892 he worked hard for Mr.

JULIUS STERLING MORTON.

sequently removed to Nebraska City, where Mr. Morton took editorial charge of the "News" for several years. He was twice a member of the Territorial

Legislature, and in 1858 was Secretary and Acting Governor. In 1860 he was declared elected to Congress by 14 majority, but lost the seat in a contest in the House. In 1868 he was nominated for Governor of Nebraska, but was defeated. He was also an unsuccessful candidate for United States Senator. He was nominated for Governor in 1882, and received 28,000 votes; and again in 1884, when he received 57,000 votes, but still not enough to elect. Mr. Morton has been actively interested in agriculture and horticulture, and has been President of the State board. He also claims to be the originator of Arbor Day. His wife died in 1881, leaving him with four sons.

The Judiciary.—Associate-Justice L. Q. C. Lamar, of the Supreme Court, died in Macon, Ga., Jan. 23, and on Feb. 2 President Harrison appointed the Hon. Howell E. Jackson, of Tennessee, to the vacant judgeship, the appoint receiving the sanction of the Senate.

HOWELL EDMUNDS JACKSON was born in Paris, Tenn., April 8, 1832, and is a son of Dr. Alexander Jackson. He graduated at the West Tennessee College in 1848, and subsequently spent two years at the University of Virginia. He afterward graduated from the law school of Cumberland University, and in 1856 began practice in Jackson, Tenn., but removed to Memphis in 1859, where he formed a copartnership with David M. Currin. Soon after the breaking out of the War of the Rebellion he was appointed to a civil position under the Confederate Government, and on the collapse of the Confederacy resumed his law practice in Memphis, where he entered into partnership with B. M. Estes. Later he formed a copartnership with Mr. Ellet, under the style of Jackson & Ellet, and became well known as an able lawyer. He removed to Jackson in 1876. He had served on two occasions as a judge of the State Supreme Court by appointment, and in 1878 was a prominent candidate for nomination on the Democratic ticket for election to the same position. In 1880 he was elected to the State Legislature from Madison County, and was always an advocate of honest dealings with the creditors of the State. In January, 1881, while a member of the Legislature, he was elected to the United States Senate. In April, 1886, he was appointed by President Cleveland to succeed the late Judge John Baxter as Judge of the Sixth United States Judicial District, which includes Tennessee, Kentucky, Ohio, and Michigan, and was serving in that capacity when called by President Harrison to the Supreme Court bench.

Associate-Justice Samuel Blatchford, of the Supreme Court, died at his home in Newport, R. I., in July; and on Sept. 19 the President nominated William B. Hornblower, of New York, as his successor; but there was much opposition in the Senate to the nomination, and it was not confirmed. Subsequently he nominated Wheeler H. Peckham, of New York, but this nomination also was rejected by the Senate. Then he nominated Senator Edward D. White, of Louisiana, who was confirmed.

Foreign Relations.—The following diplomatic and consular appointments were made by President Cleveland and confirmed by the Senate: Ambassador to Great Britain, Thomas F. Bayard, Delaware; to France, James B. Eustis, Louisiana; to Germany, Theodore Runyon; to Italy, J. J. Van Alen, Rhode Island. Minister Plenipotentiary to Austria-Hungary, Bartlett Trip, South Dakota; to Belgium, James S. Ewing, Illinois; to Brazil, Thomas L. Thompson, California; to Chili, James D. Porter, Tennessee; to Colombia, Luther F. McKinney, New

Hampshire; to Costa Rica, also accredited to Salvador and Nicaragua, Lewis Baker, Minnesota; to Denmark, John E. Risley, New York; to Greece, and also accredited to Roumania and Servia, Eben Alexander, North Carolina; to Guatemala also accredited to Honduras, P. M. B. Young, Georgia; to Hawaii, Albert S. Willis, Kentucky; to Japan, Edwin Dun, Ohio; to Mexico, Isaac P. Gray, Indiana; to Netherlands, William E. Quimby, Michigan; to Peru, James A. McKenzie, Kentucky; to Portugal, George W. Caruth, Arkansas; to Switzerland, James O. Broadhead, Missouri; to Turkey, Alexander W. Terrell, Texas; to Venezuela, Frank E. Partridge. Minister Resident and Consul-General to Hayti, Henry M. Smythe; to Persia, Alexander McDonald; Agent and Consul-General to Egypt, Frederic C. Penfield. Consul-General at Vienna, Max Judd; at Tangier, I. I. Barclay; at Rio de Janeiro, William T. Townes; at Shanghai, Alfred D. Jones; at Panama, Victor Vifquain; at Guayaquil, George G. Ballard; at Paris, Samuel E. Morse; at Dresden, William S. Carroll; at Frankfurt, Frank H. Mason; at Liverpool, Patrick A. Collins; at Manchester, Daniel W. Maratta; at Moncton, Wendell A. Anderson; at Guelph, Charles N. Daley; at Calcutta, Van Leer Polk; at Singapore, E. Spencer Pratt; at Guatemala, Henry C. Stuart; at Honolulu, Ellis Mills; at Rome, Wallace S. Jones; at Kanagawa, N. W. McIver; at Mexico, Thomas T. Crittenden; at Nuevo Laredo, Joseph G. Donnelly; at St. Gall, Irving B. Rishman. The President nominated James J. Van Alen, of Rhode Island, as ambassador to Italy, on Sept. 19, and the appointment was confirmed by the Senate on Oct. 20; but it having been freely charged in the public press that the appointment was made solely to reward Mr. Van Alen for his generous contribution to the Democratic campaign fund in 1892, Mr. Van Alen tendered his resignation to the President on Nov. 20. The letter of resignation was made public on Dec. 3, and soon afterward Wayne McVeagh, of Pennsylvania, was nominated, and his appointment was confirmed by the Senate.

His predecessor having accepted the office of arbitrator between the Argentine Republic and Brazil in the missions boundary dispute, President Cleveland received the special envoys appointed by those nations, who laid before him the evidence and argued the case in behalf of their respective governments. The revolutionary outbreak in Brazil led to the massing of a strong United States naval force in the harbor of Rio de Janeiro for the protection of American interests. On Oct. 25 Acting-Rear-Admiral Stanton, the commander of the fleet, having saluted the flagship of Admiral Mello, the leader of the revolt against the Brazilian Government, the President disavowed the act in behalf of the United States and removed the offending commander. Admiral Stanton was, however, restored on Dec. 21, and assigned to command the North Atlantic squadron. The fleet at Rio united with the naval forces of other nations in staying the bombardment of the Brazilian capital by the insurgents, and on Dec. 20 the warships New York, Miantonomah, and Bennington were ordered to Rio. In the organization of the claims commission provided for by the conven-

tion between the United States and Chili, the two governments having failed to agree upon a third member of the commission, the President of the Swiss Republic was requested to intervene as provided in the treaty, and he appointed as such third commissioner the Swiss minister to the United States. The Haytian Government was requested by the United States to modify the law whereby a sailing vessel which has discharged her cargo at a Haytian port is refused clearance until the duties on such cargo have been paid. An American mail steamer was fired on in the port of Amapala, Honduras, because her captain refused to surrender to the military authorities of Honduras a passenger in transit from Nicaragua to Guatemala. Upon the protest of the American minister and his demand for satisfaction, the Honduras Government disavowed the action of its officers and tendered an apology. The questions growing out of the seizure and use of American vessels by insurgents in Honduras and the subsequent denial of commercial privileges to such vessels by the established Government were at the end of the year in a fair way of amicable settlement. With respect to a treaty signed in Paris by the representative of the Government of Liberia, by which certain Liberian territory was ceded to France, but which treaty had not at latest advices been ratified by the Legislature of Liberia, the Government of the United States entered a friendly protest with the French Government against any impairment of Liberian territory without the unconstrained consent of that republic. The work of relocating the boundary marks between Mexico and the United States from Paso del Norte to the Pacific was nearly completed; and the commission to settle the river boundary disputes east of El Paso was making satisfactory progress. The Nicaragua Canal Company, though suffering serious financial embarrassments from the insolvency of the Canal Construction Company, was generously treated by the Nicaraguan Government, and none of the rights under its charter had been lost. Extradition treaties were proclaimed with France, with Norway, and with Russia. There was much popular opposition in this country to the extradition treaty with Russia, and numerous signed petitions were sent to the Senate protesting against its ratification, chiefly on the ground that while political offenses are exempted from its operation, the treaty provides that an attempt against the life of the Czar or any member of his family, when such attempt comprises the act either of murder, assassination, or poisoning, shall not be considered a political offense; whereas the Russian law declares that every evil intention against the life, the health, or honor of the Emperor shall subject the person guilty thereof to the penalty of death; and that evil intention shall be regarded as an actual crime, even though no attempt has been made to carry the intention into effect; whence any revolutionary conspiracy is, under the Russian law, constructively an attempt against the life of the Czar. The treaty was proclaimed on June 6, and on the following day the Government was notified by Russia that her representation at Washington would be raised to the rank of an embassy. The Bering Sea arbitration and the

relations of the United States with Hawaii are fully treated elsewhere. (See articles **BERING SEA ARBITRATION** and **HAWAII**.)

The Army.—By act of Congress the army of the United States has been limited since 1875 to 25,000 enlisted men, exclusive of the Signal Corps, the Hospital Corps, and 125 general-service clerks and 45 general-service messengers. The total strength of the army in 1893 was 25,778 enlisted men and 2,144 officers. There were 10 cavalry regiments, consisting of 432 officers and 6,050 enlisted men; 5 artillery regiments, 280 officers and 3,675 enlisted men; 25 infantry regiments, 877 officers, 12,125 men; engineer battalion, recruiting parties, ordnance department, hospital service, Indian scouts, Military Academy, signal service, and general service, 567 officers and 4,142 men. The Ninth and Tenth Regiments of Cavalry and the Twenty-fourth and Twenty-fifth Regiments of Infantry are composed of negro troops commanded by white officers. Major-Gen. John M. Schofield, commanding the army, has his headquarters at Washington. The United States is divided into 8 military departments, as follows: The Department of the East, comprising the New England States, New York, New Jersey, Pennsylvania, Delaware, Virginia, West Virginia, North Carolina, South Carolina, Georgia, Florida, Louisiana, Mississippi, Alabama, Kentucky, Tennessee, Ohio, and the District of Columbia, is commanded by Major-Gen. Oliver O. Howard, with headquarters at Governor's Island, N. Y. The Department of the Missouri, comprising Michigan, Wisconsin, Indiana, Illinois, Missouri, Kansas, Arkansas, Indian Territory, and Oklahoma Territory, is commanded by Major-Gen. Nelson A. Miles, with headquarters at Chicago. The Department of California, comprising California and Nevada, is commanded by Brig-Gen. Thomas H. Ruger, with headquarters at San Francisco. The Department of Dakota, comprising Minnesota, the northern part of South Dakota, North Dakota, Montana, and the post of Fort Yellowstone, Wyo., is commanded by Brig-Gen. Wesley Merritt, with headquarters at St. Paul, Minn. The Department of Texas, comprising the State of Texas, is commanded by Brig-Gen. Frank Wheaton, with headquarters at San Antonio. The Department of the Platte, comprising Iowa, Nebraska, Wyoming, Utah, the eastern part of Idaho, and the southern part of South Dakota, is commanded by Brig-Gen. John R. Brooke, with headquarters at Omaha, Neb. The Department of the Colorado, comprising Arizona, New Mexico, and Colorado, is commanded by Brig-Gen. A. McD. McCook, with headquarters at Denver, Col. The Department of the Columbia, comprising Oregon, Washington, the western part of Idaho, and Alaska, is commanded by Brig-Gen. Elwell S. Otis, with headquarters at Vancouver Barracks, Wash. Brig-Gen. George D. Ruggles was adjutant-general of the army; Brig-Gen. Richard N. Batchelder, quartermaster-general; Brig-Gen. William Smith, paymaster-general; Brig-Gen. John P. Hawkins, commissary-general; Brig-Gen. George M. Sternberg, surgeon-general; Brig-Gen. Adolphus W. Greeley, chief signal officer; Brig-Gen. Thomas L. Casey, chief of engineers; Brig-Gen. Daniel W. Flagler, chief of ordnance; Brig-Gen.

Joseph C. Breckinridge, inspector-general; and Col. Guido N. Lieber, acting judge-advocate-general. Of field officers below the rank of brigadier-general, there were 71 colonels, 90 lieutenant-colonels, and 211 majors. The expenditure of the Department of War for 1893 was: For salaries and contingent expenses, \$1,992,582; for the support of the military establishment, \$23,377,828; for miscellaneous objects, \$6,077,033; for river and harbor improvements, \$15,296,876; and for fortifications, etc., \$3,266,141; total, \$51,966,075. The new magazine rifle selected for the army by the board appointed for that purpose, and manufactured at the national armory at Springfield, was expected to be issued to the troops in December. The enrolled militia of the several States numbered on the last day of October 112,597 men of all ranks.

Pensions.—The total number of names on the pension rolls on June 30, 1893, was 966,012, an increase of 89,944 over the preceding year. Of those on the rolls there were 17 widows and daughters of Revolutionary soldiers, 86 survivors of the War of 1812 and 5,425 widows of soldiers of that war, 21,516 survivors and widows of the Mexican War, 3,882 survivors and widows of Indian wars, 284 army nurses, and 475,645 survivors and widows and children of deceased soldiers and sailors of the civil war. These were pensioned on account of disability or death resulting from army and navy service, and remaining names on the rolls, numbering 459,155, are of those who were pensioned under the act of June 27, 1890, on account of death and disability not chargeable to army service. During the year there were 123,634 new names added to the rolls, and 33,690 were dropped therefrom. On pensions allowed during the year, the first payments amounted to \$33,756,950, including arrears; and the entire expenditure on account of pensions during the year was \$156,740,467.

Postal Service.—The number of post-offices in the United States on June 30, 1893, was 68,403, an increase during the fiscal year of 1,284. Of the whole number of post-offices, 3,360 were presidential, an increase in that class of 204. The total number of free-delivery offices was 610, the number added during the year being 42. Under the law 93 additional cities and towns were entitled to this service. The revenue of the department for the year amounted to \$75,896,933, and the expenditure to \$81,074,105. The original estimates for the year ending June 30, 1894, contemplated a surplus of revenue over expenditure of \$872,245, but the present Postmaster-General estimated in December that instead of a surplus there would be a deficit of nearly \$8,000,000. The falling off in the receipts of the department is attributed chiefly to the depressed condition of business throughout the country. The number of domestic money orders issued during the fiscal year was 13,309,735, amounting to \$127,576,433, an increase of 1,240,293 in number and \$7,509,632 in value over the preceding year. Postal notes to the value of \$12,903,076 were also issued during the year. The number of international money orders issued during the year was 1,055,999, of the value of \$16,341,827, an increase over the preceding year of 72,525 in number and \$1,221,506 in value. The total issue of money orders and postal notes during the

year amounted to \$156,821,348. The number of letters and packages mailed for special delivery was 3,375,693, an increase over the preceding year of about 22 per cent. The receipts from special-delivery stamps amounted to \$337,569, and the messengers' fees amounted to \$256,592, leaving a net revenue from this source of \$80,977.

Indians.—The Indians in the United States number about 248,000, most of whom are located on 161 reservations, containing 86,116,531 acres of land. About 110,000 of the Indians have to a considerable extent adopted civilized customs, and lands in severalty have been allotted to many. The allotments during the fiscal year ending June 30, 1893, were about 1,000,000 acres to 10,000 individuals. The Government schools for the instruction of the Indians numbered 195, of which 170 were on reservations, and of these 73 were boarding schools. The number of Indian children enrolled during the year as school attendants was 21,138, an increase of 1,231 over the preceding year. The appropriations on account of the Indian Bureau for the fiscal year of 1893 amounted to \$8,342,095, and for the fiscal year of 1894 they were \$7,954,963.

Chinese Exclusion Act.—Section 6 of the act to prohibit the coming of Chinese persons into the United States, approved May 6, 1892, and commonly known as the Geary law, made it the duty of all Chinese laborers in the United States to apply at the internal-revenue office in their respective districts within a year from the passage of the act for a certificate of residence, failing which such laborer found in the United States after the expiration of the year provided should be deemed unlawfully in the country, and should be arrested by any United States customs or revenue official or United States marshal and taken before a United States judge, whose duty it should be to order his deportation from the United States. Acting under the advice of the Chinese Six Companies of California, the Chinese generally made no attempt to comply with the law, and out of 100,000 in the country only about 4,000 had registered at the expiration of the year provided for in the act. On May 4, 1893, the day of the expiration of the time for registration, the Secretary of the Treasury issued an order directing all customs and revenue officials to refrain from making any arrests under the act until further orders from the department; and the Attorney-General supplemented this circular by instructing United States district attorneys to defer proceedings under the act. A case to test the constitutionality of the act was made under an arrangement between the Government and the Chinese Six Companies by the arrest of three Chinamen in New York, who were taken before the United States circuit court, and, as they could show no certificates of registration, were ordered to be deported to their native country. The case was then hurried on appeal to the United States Supreme Court, where it was decided that the law was constitutional, and the judgment of the lower court must be affirmed. Justice Gray, in handing down the decision on May 15, said it was thoroughly settled as one of the fundamental principles of the law of nations that every independent nation had the inherent right to keep aliens out of its territory and order them to get out of its territory. It had been

settled in two cases that the power of exclusion might be vested in executive officers, and the aid of the judiciary might be invoked. Matters executive and political in the first instance may then take judicial force. The courts have no right to revise the decisions or the action and effect in these cases. If Congress make a law inconsistent with a treaty, it may give a foreign nation the right to complain, but the duty of the courts of the United States is clear and they must recognize its force. Congress had the right to prescribe what evidence shall be demanded before its judicial tribunals. It was within its power to provide that those aliens who have been a year within the United States without taking out a certificate should be deported. It had the right to define what witnesses should be heard; a right to protect the courts against the testimony of persons who had no regard for the sanctity of an oath. He would not touch upon the policy, the wisdom, even the justice of the act; those questions were for the political, the executive, and legislative departments of the Government, if the act were within their constitutional powers, and it would be out of place for the courts to interfere. Congress had simply provided for the deportation of persons whose presence it considers inconsistent with the public welfare; and there was nothing in the Constitution or the laws which impugned the power of Congress to compel the Chinese to leave the country. Justices Brown, Shiras, Blatchford, and Jackson concurred; Chief Justice Fuller and Justices Field and Brewer filed dissenting opinions; and Justice Harlan was in Paris. Of the appropriation made by Congress for the purpose of carrying out the provisions of the Geary law only about \$37,000 remained unexpended, whereas it was estimated that it would require at least \$5,000,000 to deport the Chinese who were unlawfully in the United States; and after a Cabinet conference the Secretary of State announced on May 17 that it had been decided that as Congress had failed to appropriate sufficient money for the purpose, no attempt would be made by the Administration to carry out the provisions of the act. The Chinese accordingly were allowed to remain undisturbed; and Congress, by an act approved Nov. 3, 1893, extended the time for registering and obtaining certificates for six months from that date, after the expiration of which the provision for deportation should be enforced as provided in the act of 1892.

UNITED STATES, FINANCES OF THE.

The fiscal year of the United States ends on June 30, at which time the receipts and expenditures of the Government for the previous year are made up and published. The condition of the Treasury and of the amount of money in circulation is published monthly, and the condition of the national banks is reported from time to time as called for by the Comptroller of the Currency. The fiscal operations of the Government and the condition of the Treasury and banks will therefore be reported to the latest dates obtainable.

Of the receipts and expenditures of the Treasury for the year ending June 30, 1893, as compared with that for the previous year, the receipts show an increase of about \$7,000,000 in

internal revenue, and of \$26,000,000 in customs. No marked change appears in the items of any other kind. The expenditures show an increase of \$25,000,000 on account of pensions, and of \$4,000,000 on account of interest on the public debt.

The several items of both receipts and expenditures for 1893, compared with like items for 1892, will be seen by the following table:

RECEIPTS.

SOURCES.	YEAR ENDING JUNE 30.	
	1893.	1892.
Internal revenue	\$161,037,624	\$153,971,073
Postal service	75,596,938	70,980,476
Customs	208,355,017	177,452,964

Public debt, principal	889,580,045	886,995,956
Grand total	\$848,904,932	\$754,949,763

The condition of the public Treasury is reported for Dec. 31, 1893, and the several items of assets and liabilities at that time, compared with like items for 1892, is shown in the statement below. It will be seen that the gold coin and bullion in the Treasury decreased about \$80,000,000 during the year, and at the same time there was an increase of silver dollars and bullion of \$37,000,000. Of the United States old issue usually known as

greenbacks, there was an increase of \$29,000,000, owing largely to the issue of currency certificates under act of June 8, 1872, for the redemption of which United States notes of like amount are required to be held.

Of the liabilities, there was a decrease of gold certificates of about \$64,000,000; an increase in that of silver certificates of about \$9,000,000; of currency certificates, \$81,000,000; of Treasury notes of 1890, \$28,000,000; while of the general Treasury balance, including the gold reserve, there was a decrease of about \$40,000,900. This decrease has been brought about by the falling off in the receipts of the Treasury, especially in the receipts of customs since June 30, 1893, the end of the fiscal year reported; consequently, to meet current obligations the Secretary of the Treasury has been obliged to decrease the Treasury balance below the limit of \$100,000,000, which amount had been informally set aside and declared to be a fund for the redemption of United States notes, of which fund \$95,000,000 was procured by the sale of bonds in 1878 under the redemption act of Jan. 14, 1875.

The following table shows the items for 1893 compared with like items for 1892:

ITEMS.	Dec. 31, 1892.	Dec. 31, 1893.
Assets:		
Gold coin and bullion.....	\$158,906,779	\$288,559,801
Standard silver dollars and bullion.....	488,671,082	451,799,087
U. S. notes (old issue).....	44,189,303	15,747,475
Treasury notes of 1890.....	1,194,884	2,706,966
National bank notes.....	12,857,628	6,048,059
Balances in national bank depositaries.....	15,901,045	15,692,654
Gold certificates.....	75,690	24,254,750
Silver certificates.....	5,083,554	8,748,498
Bonds and interest checks paid.	14,106	18,646
Currency certificates, June 8, 1872.....	40,000	490,000
Minor coins and fractional currency.....	939,085	855,690
Fractional silver coins.....	11,689,467	10,571,481
Total.....	\$787,614,701	\$769,780,982
Liabilities:		
Gold certificates.....	\$77,487,769	\$141,847,889
Silver certificates.....	384,584,504	325,783,504
Currency certificates, June 8, 1872.....	89,065,000	7,590,000
Treasury notes of 1890.....	158,160,151	124,745,623
Redemption national bank notes.....	6,817,295	6,215,474
Public disbursing officers.....	81,851,146	80,796,751
Outstanding checks and drafts.....	4,253,181	4,209,158
Redemption U. S. notes, gold reserve.....	80,891,000	100,000,000
General Treasury balance.....	2,483,955	29,092,588
Total.....	\$787,614,701	\$769,780,982

The public debt of the United States is divided into two classes, one of which is the debt having no reserve, the other the debt for which an equivalent reserve in cash is held. The debt having no reserve of itself fully indicates the net changes in the condition of the outstanding debt, and is shown in the table below.

It will be seen that, except in the legal-tender notes, there has been no material change in the amount of the debt outstanding at the end of the calendar year 1893, as compared with that of the year previous. The increase of \$18,000,000 in the debt without reserve on account of the notes arose from the use of the reserve to pay current expenses:

CHARACTER.	OUTSTANDING.	
	Dec. 31, 1892.	Dec. 31, 1893.
Four and one half per cents. continued at 2 per cent.....	\$25,364,500	\$25,364,500
Four-per-cent. bonds.....	559,610,700	559,592,400
Four-per-cent. certificates.....	64,110	76,180
Old loans matured.....	1,918,580	2,385,045
Old demand notes.....	55,647	55,647
Legal-tender notes (old issue).....	265,759,416	246,681,016
National bank redemption account.....	23,015,908	23,466,502
Fractional notes.....	6,900,505	6,908,462
Total.....	\$883,714,316	\$864,524,752

Of the debt having equivalent cash reserve, there has been a decrease in that of the legal-tender notes equivalent to the increase as above stated, and in that of gold certificates of about \$64,000,000. At the same time there has been an increase of the Treasury notes of 1890 of about \$9,000,000, and of clearing-house certificates \$32,000,000. This statement is of value only as showing the enormous amount of cash held by the Treasury in the character of a financial agent, to meet certificates and notes, and which is available for no other purpose. The amount held in no way affects the net debt of the country. The detailed amounts are shown in the table below:

CHARACTER OF DEBT.	CHARACTER OF RESERVE.	OUTSTANDING.	
		Dec. 31, 1892.	Dec. 31, 1893.
Legal tender (greenbacks).....	Coin.	\$50,891,600	\$100,000,000
Treasury notes of 1890.....	Coin.	158,160,151	124,745,623
Clearing-house certificates.....	Notes.	89,085,000	7,590,000
Gold certificates.....	Gold.	77,487,769	141,847,889
Silver certificates.....	Silver dollars.	384,584,504	325,783,504
Total.....	\$685,809,024	\$699,467,016

The money in circulation outside of the Treasury on Jan. 1, 1894, as compared with Jan. 1, 1893, is shown in the table below. It will be seen that there is an increase in the gold coin of about \$86,000,000; of silver certificates, about \$7,000,000; of Treasury notes, \$29,000,000; of currency certificates, \$32,000,000; and of national bank notes, \$18,000,000; while there is a decrease in the amount of United States notes of about \$28,000,000, and a small decrease in several of the other items. The large increase in the amount of the gold coin in circulation outside of the Treasury was probably due to the withdrawing of such coin represented by certificates from the Treasury and hoarding it in the banks. The increase in the amount of national bank notes outstanding can be attributed to the action of the banks in taking advantage of the decreased price in United States bonds which prevailed during the fall on account of the stringency in money to purchase the bonds and take out circulation thereon. The table at the top of the next page shows the money in circulation outside the United States Treasury.

The last statement in 1893 showing the condition of the national banks called for by the Comptroller of the Currency was of Oct. 3, 1893, and comparison of the items of that date is made with like items of Sept. 30, 1892. It will be seen that in number there was an increase during the year of only 8 banks, and that there

CHARACTER.	AMOUNT.	
	Jan. 1, 1894.	Jan. 1, 1893.
Gold coin	\$508,602,811	\$412,970,960
Standard silver dollars	57,899,589	62,322,986
Subsidiary silver	65,854,740	67,327,267
Gold certificates	77,412,179	117,093,189
Silver certificates	329,545,650	322,083,011
Treasury notes, act of July 14, 1890	151,965,287	122,089,656
United States notes	802,541,314	830,938,540
Currency certificates, act of June 8, 1873	39,045,000	7,100,000
National-bank notes	194,181,316	168,861,365
Total	\$1,739,018,266	\$1,610,638,874

was a falling off during the period of over \$400,000,000 in the resources of the banks, and of course a like amount in that of the liabilities. The larger part of this decrease arises from the item of loans and discounts, the bank having contracted their accommodations on account of the financial depression prevailing at that period, which has largely continued since. Following is a statement showing number and condition of the national banks at dates named:

ITEMS.	OCT. 8, 1893.		SEPT. 30, 1893.	
	2,781 banks.		2,773 banks.	
Resources:				
Loans and discounts	\$1,848,634,167 51	\$2,171,041,068 11		
Bonds for circulation	206,483,850 00	169,375,800 00		
Bonds for deposit	14,816,000 00	15,289,000 00		
U. S. bonds on hand	2,760,950 00	4,382,250 00		
Other stocks and bonds	148,599,644 28	154,585,514 54		
Due from reserve agents	94,740,014 97	140,516,858 09		
Due from national banks	24,229,106 82	82,572,785 51		
Due from State banks	59,181,776 08	57,861,911 86		
Real estate, etc.	11,071,996 65	10,817,125 98

Specie	114,709,852 00	104,267,945 00		
Legal-tender notes	7,090,000 00	13,995,000 00		
U. S. certificates of deposit				
Five-per-cent. fund with Treasurer	8,977,414 18	7,139,564 69		
Due from U. S. Treasurer	1,962,749 85	1,104,937 98		
Total	\$3,109,563,234 86	\$3,510,094,597 46		
Liabilities:				
Capital stock	\$678,540,288 93	\$686,578,015 00		
Surplus fund	246,750,751 82	238,371,424 84		
Undivided profits	108,474,062 57	101,852,754 66		
National-bank circulation	132,929,725 90	143,428,298 00		
State-bank circulation	75,069 50	75,076 50		
Dividends unpaid	2,574,097 59	3,888,626 73		
Individual deposits	1,451,124,380 55	1,765,422,988 68		
U. S. deposits	10,546,185 51	9,323,144 24		
Deposits of U. S. disbursing officers	8,776,438 21	4,044,734 04		
Due to national banks	226,432,979 06	352,046,194 05		
Due to State banks	122,391,098 21	173,607,018 24		
Notes and bills rediscounted	21,066,787 01	17,182,487 71		
Bills payable	27,436,937 54	6,549,168 65		
Liabilities other than those above stated	81,632,352 16	1,979,746 97		
Total	\$3,109,563,234 86	\$3,510,094,597 46		

In this connection it is interesting to note the condition of State banks, and the following abstract is made of the principal items published by the Comptroller of the Currency from the last returns received in his office from such banks in 1893. It will be noted that of State banks there are more in number than of nation-

al banks, although the capital stock is not one half as great. These banks are largely located in the Southern and Western States. The figures do not include returns from loans and trust companies, or from savings banks, holding large amounts of deposits mainly in the New England and Middle States:

GEOGRAPHICAL DIVISION.	No. of banks.	Loans and discounts.	Capital stock.	Deposits.
Total	3,836	\$771,071,058	\$258,516,981	\$717,652,329
Eastern States	14	6,742,197	3,956,675	5,702,150
Rhode Island	6	1,603,590	916,675	909,777
Connecticut	8	5,138,607	2,940,000	4,792,373
Middle States	318	287,444,780	45,767,507	253,194,912

The total coinage of the country for the fiscal year 1893 amounted to \$43,635,173, of which about \$30,000,000 was of gold. That portion of the act of July 14, 1890, requiring the Secretary of the Treasury to purchase 4,500,000 ounces of silver every month at best rates obtainable, and issue therefor Treasury notes designed to circulate as money, was repealed on Nov. 1, 1893, leaving no authority of any kind for the further coinage of silver dollars, unless, as claimed by some, the difference between the amount paid for the silver bullion purchased under this act and the number of silver dollars into which it could be fabricated, amounting to about \$60,000,000, could be coined.

Under the provisions of the act of 1890 the total amount of silver purchased from Aug. 13, 1890, the date the act went into effect, to Nov. 1, 1893, the date of the repeal of the purchasing clause, aggregated 168,874,682 fine ounces, costing \$155,931,002, for which Treasury notes of a like amount were issued. This silver would make 218,084,438 silver dollars, indicating a profit in the transaction of \$62,153,436. A small portion of this profit has been coined. The remainder is held by the Treasury as a bullion reserve to meet the payment of the notes upon demand.

The depreciation in the price of silver bullion has caused the bullion value of a silver dollar at present quotations to be worth only about 56½ cents; the average value of such dollar during 1893 was about 65 cents. Various causes are assigned for this depreciation, but the largely increased products of silver would seem to be sufficient to explain it. For the year 1890 the estimated production of silver in the world was about 75,000,000 of fine ounces, and this or less was the yearly production for several preceding years. From that date, however, the production steadily increased, until in 1888 it arose to 109,000,000, in 1890 to 133,000,000, and in 1892 to 151,000,000 ounces fine, the price, meanwhile, falling from \$1.15 an ounce fine to 73 cents, and the low price still continues.

URUGUAY, a republic in South America. The Senate is composed of 19 members, 1 for each department, elected for six years by electoral colleges; the Chamber of Deputies has 60 members, elected for three years by direct suffrage. The President is elected for four years. Dr. J. Herrera y Obes was elected President for the term ending March 1, 1894.

Finances.—The revenue for the year ending June 30, 1891, was 14,925,363 pesos or dollars, of which 8,302,806 pesos were derived from customs, 1,738,385 pesos from direct taxation, 1,001,468 pesos from patent-office fees, and 3,887,704 pesos from other sources.

The public debt in the beginning of 1893 amounted to 104,072,739 pesos.

Commerce.—The total value of the imports in 1892 was 18,404,000 pesos, of which Great Britain imported 5,648,000 pesos; France, 2,259,000 pesos; Germany, 2,082,000 pesos; Italy, 2,020,000 pesos; Spain, 1,776,000 pesos; Brazil, 1,318,000 pesos; the United States, 1,105,000 pesos; the Argentine Republic, 1,073,000 pesos, and other countries, 1,118,000 pesos. Of the exports, 4,514 pesos went to Brazil, 4,479,000 pesos to Great Britain, 4,410,000 pesos to France, 3,165,000 pesos to Belgium, 2,985,000 pesos to Argentina, 2,224,000 pesos to the United States, 2,007,000 pesos to Germany, and 2,148,000 pesos to other countries. The following were the values of the chief exports: Hides and leather, 7,898,000 pesos; wool, 7,420,000 pesos; meat, 4,108,000 pesos; extract of meat, 1,840,000 pesos; tallow, 1,361,000 pesos; animals, 1,115,000 pesos.

Communications.—The railroads in operation in 1892 had a length of 980 miles. There were 2,950 miles of telegraphs in 1891. The number of dispatches was 256,467. The post-office forwarded 6,188,073 letters, 50,970 postal cards, and 16,475,572 pieces of printed matter in 1892.

UTAH, a Territory of the United States, organized Sept. 9, 1850; area, 84,970 square miles; population in 1890, 207,905. Capital, Salt Lake City.

Government.—The following were the State officers during the year: Governor, Arthur L. Thomas, succeeded in April by Caleb W. West, Democrat; Secretary, Elijah Sells, succeeded in May by Charles C. Richards, Democrat; Auditor, Arthur Pratt, Republican; Treasurer, J. D. Barnett, Republican; United States District Attorney, Charles S. Varian, succeeded in May by John W. Judd, Democrat; Superintendent of Common Schools, Jacob S. Boreman; United States Marshal, Irving A. Benton, succeeded in May by Nat. M. Brigham; Chief Justice of the Supreme Court, Charles S. Zane, Republican; Associate Justices, James A. Miner and George W. Bartch, Republicans, and John W. Blackburn, succeeded in May by H. W. Smith, Democrat.

Finances.—The following items are from the Governor's report to the Secretary of the Interior in October: The total acreage of public lands disposed of and settled at the Salt Lake Land Office from its opening in March, 1869, to the end of the fiscal year ending June 30, 1893, was 6,245,869, and the total value of the land \$1,469,941. The total assessed valuation of property and improvements is as follows: Real, \$62,019,752; improvements, \$23,864,848; personal, \$23,475,511; total, \$108,860,111.

The total assessed valuation of the property of incorporated cities and towns of the Territory is \$94,533,352, and the aggregate indebtedness \$2,098,030. The former have increased \$7,333,270, and the latter decreased \$17,648. The total number of live stock assessed is 1,666,857, with an assessed valuation of \$8,145,078. The bank statement shows a total capital of \$5,693,648, with deposits aggregating \$9,237,76. The school taxes reach an annual aggregate of \$360,000.

Transportation Lines.—Reports of railway construction for 1893 give the amount of track laid in Utah as 19-57 miles, divided among 3 lines. The aggregate mileage is 1,328.

The Utah Central was put into the hands of receivers in November, on petition of the Central Trust Company, of New York, which held a mortgage on the property of the Utah Central in lieu, having guaranteed \$225,000 bonds issued by the railroad company, which had defaulted the last two payments.

The Bear River Canal was sold at auction in May, under foreclosure by a trust company, for \$87,500. The canal system has cost over \$1,500,000, and but one branch of the canal is completed. That branch waters about 5,000 acres, and the land is included in the sale.

Education.—The University of Utah this year granted diplomas to a class of 31, of whom the greater part were in the three and four years' normal courses, 1 in the mining, and 3 in the general science course. Arrangements have been made for courses of reading and study for nonresident students. These will be supplemented by lectures delivered by members of the faculty to parties engaging to pay the expenses of the lecturer for travel and entertainment. The university is now on a better footing than ever, Congress having granted to it 60 acres of

the Fort Douglas reservation as a site for buildings if occupied within five years. The commissioners are authorized to locate university lands and sell them at a minimum price of \$2.50 an acre.

The Agricultural College has a new building, for which appropriation was made by the last Legislature. Two new chairs have been established—those of Hydraulics and Lacticology. In April 370 students were enrolled for the coming year.

It has been decided to establish at Salt Lake City a university under the care of the Presbyterian Church. Ogden offered a large cash and land bonus and the building partly finished as a university by the Methodist Episcopal Church. Salt Lake City gives land.

The Church university was opened at Salt Lake City in September. It is founded and endowed by the Church of the Latter-Day Saints, but will be open to students who are not members as well as to members of the Church, and there will be no charge for tuition except, the first year, an admission fee of \$5. It is the intention to have full courses of study leading to the degree of Bachelor of Arts.

Homes and Farms.—A census bulletin sums up the showing of statistics on ownership and indebtedness of homes and farms in the Territory:

In regard to farms the conclusion is that 9.43 per cent. of the farm families hire, and 90.57 per cent. own the farms cultivated by them; that 5.55 per cent. of the farm-owning families own subject to incumbrance, and 94.45 per cent. own free of incumbrance. Among 100 farm families 9 hire their farms, 5 own with incumbrance, and 86 without incumbrance. On the owned farms there are liens amounting to \$546,245, which is 24.93 per cent. of their value, and this debt bears interest at the average rate of 10.13 per cent., making the average annual interest charge \$98 to each family. Each owned and incumbered farm, on the average, is worth \$3,870 and is subject to a debt of \$915.

The corresponding facts for homes are that 39.85 per cent. of the home families hire and 60.15 per cent. own their homes; that of the home-owning families, 91.49 per cent. own free of incumbrance, and 8.51 per cent. with incumbrance. In 100 home families, on the average, 39 hire their homes, 5 own with incumbrance, and 56 without incumbrance. The debt on owned homes aggregates \$1,428,698, or 27.70 per cent. of their value, and bear interest at the average rate of 9.71 per cent., so that the annual amount of interest to each home averages \$100. An average debt of \$1,028 incumbers each home which has the average value of \$3,711.

Mining.—The product of gold, silver, lead, and copper of the Territory had in 1892 a seaboard value of \$16,276,818. In 1893 it fell off to \$12,832,074, the decrease being in silver, lead, and copper, while the production of gold increased over 40 per cent. Of the condition of this industry the report of the Utah Commission, made in September, to the Secretary of the Interior, says:

Mining is one of the most important industries of Utah—nay, of the whole intermountain region. Until recently it was admittedly the principal factor of progress and improvement in the Territory. Certainly it has been the chief incentive to non-Mormon immigration to the Territory. It has served to stimulate the building of cities, towns, railroads, factories, and agricultural production. It gave remunerative employment to thousands of laborers. But all this is now changed. The mines are closed, their output of gold

and silver, of copper, of lead and iron, is arrested, while as a consequence multitudes of laborers are left stranded in idleness and desperation. The condition of the mining region is indeed deplorable. The Commission speaks of the fact, but does not undertake to trace its controverted source.

The first stage returned from the San Juan gold fields (described in the "Annual Cyclopædia" for 1892, page 772) in January to Dolores, having made the trip to Bluff City and return in four days, with 1 coach, 6 horses, and 21 passengers. Rich strikes have been made in the Henry mountains, and it is predicted that this is the coming gold district of the West. A new mining district was organized there on Jan. 27, to be known as the Gold Belt Mining District.

The report of the United States Inspector of Coal Mines says that, "with one or two exceptions, the mines have been worked in a very primitive and incompetent manner. The superintendents, as a rule, generally open out rooms as soon as the coal is reached (in one case the map has a great resemblance to a fan), and rooms are driven into one another, thereby leaving an insufficiency of pillars to support the roof. Not even in the opening of a coal mine has there been the slightest attention paid to the most elementary study of the geological structure of the coal field, and the result is that the mine is practically worked out when it should only have reached its maximum capacity." The coal output of 1892 is estimated at 360,508 tons.

The Commission.—The Appropriation bill in Congress contained, when it came from the House, in February, 1893, a provision abolishing the Utah Commission, and imposing its duties on the Governor, Chief Justice, and Secretary of the Territory, without additional compensation. The Senate Committee on Appropriations proposed to strike out that provision, and after debate it was decided to retain the Commission, \$10,000 being appropriated for their salaries and \$7,000 for expenses. The House concurred in these provisions. H. C. Lett, of Utah, was appointed a member of the Commission, in place of A. G. Saunders, the law requiring that the appointment be made from residents of the Territory in future. The other members, besides the chairman, Commissioner A. B. Williams, of Arkansas, Democrat, are: Gen. John A. McClelland, Democrat, of Illinois; R. S. Robertson, Republican, of Indiana; and Col. Godfrey, Republican, of Iowa.

Among the duties of the Commission was the appointment of registration officers.

The Women's Industrial Home at Salt Lake City was put in charge of the Commission, as directed by Congress. This institution was built by the Government about 1886, "to be used and occupied by it for the purpose of aiding in the suppression of polygamy and of furnishing an industrial home and providing employment and means of self-support for dependent women who renounce polygamy, and the children of such women of tender age." The experiment has cost the National Government nearly \$100,000, and has proved a failure, very few women caring to avail themselves of its privileges. At last reports, there were not more than twenty inmates, of whom about half were children.

The Columbian Exposition.—The Territory made a very creditable and satisfactory exhibit at the fair. The agricultural and manufacturing displays were good, and the mineral exhibit was very good. The Utah Sugar Works took the first prize for sugar. Much interest was taken in the Utah silk exhibit in the Woman's Building. Attempts at silk culture, to which the climate is well adapted, were made very early in the history of the Territory. Utah County has a flourishing silk association, and produces some good material. The Utah building was finished early in the season, but the formal dedication was put off to Sept. 8, in order to have the presence of the Tabernacle choir. The singing of the choir was one of the features of the exposition. Utah day was one of the great days of the fair, only two others, up to October, surpassing it in point of attendance—July 4 and Illinois day.

Statehood.—The bill to admit Utah as a State passed the Lower House of Congress Dec. 13, having been reported from the Territories' Committee Nov. 2. The committee discussed at length the troublesome question of polygamy and declared that the evil had been suppressed entirely, and that there need be no fear of a revival of the practice in case Utah be admitted to the Union.

The Escheated Church Funds.—The personal property of the Church of Jesus Christ of Latter-Day Saints, which has so long been in litigation, was restored by joint resolution of Congress, approved Oct. 25.

The New Temple.—The sixty-third annual Mormon Conference at Salt Lake City in April, from the 4th to the 25th, was one of the most notable gatherings of the Latter-Day Saints that have ever been assembled. There were 5 meetings in the Tabernacle, 31 regular dedication assemblies in the Temple, 3 special meetings, and two days devoted to the Sunday-school children. It is estimated that at least 62,000 members of the Church passed through and attended services in the Temple, and about 12,000 Sunday-school children in addition viewed the building. People came from the different settlements from Idaho to Arizona, and even Mexico, and from Colorado to Nevada. The occasion of this unusual gathering was the dedication of the Temple, which has been forty years in building—or, rather, forty years have passed since it was begun.

The original Temple of the Mormons was built in Kirtland, Ohio, in 1834. Their first colony had been guided thither, from various localities in New York and Pennsylvania, by Sidney Rigdon. Joseph Smith asserted that a revelation gave him the dimensions of this Temple—80 feet by 60 feet on the ground. It was completed in 1834, at a cost of \$40,000. The building is still standing, but it is under the control of Joseph Smith, Jr., who stands at the head of the nonpolygamous branch of the Mormons. (See REORGANIZED CHURCH OF JESUS CHRIST OF LATTER-DAY SAINTS, in this volume.) In outward appearance the Temple at Kirtland resembles one of the older class of meeting houses in New England.

Soon after the building of the Temple the Mormons left for Nauvoo, Ill., where they built

up and inhabited a prosperous city for about ten years. Here they erected their second Temple, at a cost of about \$1,000,000. Owing to quarrels with the surrounding Gentiles, the Mormons once more, in 1846-'47, moved across the plains to Utah. Joseph Smith and his brother Hyrum

FIRST MORMON TEMPLE, KIRTLAND, OHIO.

had been killed by a mob, and the torch had been applied to Nauvoo. The Temple was spared only to be robbed, and finally burned in 1848. It was a magnificent structure of sandstone, with a very large seating capacity. The height of the dome was 210 feet. A baptismal font, the special feature of this Temple, rested on the backs of 12 oxen, the whole being carved from one immense block of stone.

The Mormons have many temples in Utah, Arizona, and Idaho, but the edifice dedicated April 6, 1893, in Salt Lake City, claims pre-eminence. It is the successor of the temples at Kirtland and Nauvoo, from the fact that the dignitaries of the Mormon Church attend within its walls. But it is not the meeting place for large congregations, that function being still reserved for the Tabernacle that stands at the rear of the Temple. The Temple itself is for sacred rites, and none but Mormons are allowed to enter its doors. The site of the Temple was selected by Brigham Young in July, 1847, but a few days after, the Mormon emigrants had crossed the Wasatch range and located themselves on Mexican soil, where Salt Lake City now stands. The colony prospered so rapidly, through thrift, aided by irrigation, that the General Assembly of the Church, in April, 1851, voted to build the Temple. In February, 1853, ground was broken, and on April 6 of the same year (just forty years before the dedication) the four corner stones were laid with impressive ceremonies. At that time the building material most used was adobe. At Red Butte Cañon, close to the city, a red sandstone was found, and of this and adobe it was decided to build the

Temple; but before the foundation was begun a very desirable stone—a gray granite—was discovered at Cottonwood Cañon, 20 miles south of Salt Lake City, and this stone was chosen. For many years the huge stones were carted by oxen, four days being often required for the trip. But of late the work was done more rapidly by the aid of a railroad. The work was interrupted in 1857, when Gen. Albert Sidney Johnston's army was approaching Salt Lake for the purpose of

niversary of the organization of the Mormon Church.

From inception to completion the Temple has been the work of Mormons alone. Brigham Young claimed to have had a revelation giving the measurements, as Joseph Smith had of the old Temple at Kirtland. The plans were drawn by Truman O. Angell, who watched the progress of the work from the beginning, the original plan being followed in all important respects. When

THE NEW MORMON TEMPLE, SALT LAKE CITY.

subduing insubordination to the Government on the part of the Mormons. The people then covered the foundations of the Temple, and fled from the city till the storm had passed. Another interruption came in 1869-'70, when the Union Pacific Railroad was under construction, and still another more recently, when a receiver was appointed under the Edmunds-Tucker act to control the escheated property of the Church, and a seizure of the Temple was made. It was in the possession of the receiver for a short period. Aside from these interruptions the work was prosecuted steadily till the cap stone was laid, on April 6, 1892; and the dedication was set for April 6, 1893, the sixty-third an-

no Mormons were found with skill enough to undertake particular tasks, some of the youths were sent to the Eastern States or to foreign countries to qualify themselves. The elevation does not show the lines of any recognized order of architecture, nor do the details seem to follow any particular order. The Temple is impressive both for its elevated site and for its size. The extreme length is 186 feet 6 inches, and the width 99 feet. With the towers, it covers an area of 21,850 square feet. The foundation wall is 16 feet thick and 16 feet deep. On this the granite walls are 9 feet thick at the bottom, and narrow to 6 feet at the top. There are 6 towers, 3 on the east end, and 3 on the west. The height of the

loftiest spire is 222 feet 5 inches, and the height of the curtain walls that connect the towers is 167 feet. The towers at the 4 corners are 26 feet square at the base. Those on the east are 200 feet high, and on the west 194 feet. The east central tower of the building is 222 feet 6 inches high. It is surmounted by the cap stone, the last piece of work done to the exterior, and by a figure representing the angel Maroni, a statue twelve feet high, of hammered copper plated with heavy gold leaf. The angel Maroni, according to the Mormon belief, appeared and revealed to Joseph Smith the hiding-place of the golden tablets, on which is inscribed the Book of Mormon. This took place at the hill Cumorah, near Palmyra, N. Y., before the Mormons went to Kirtland. At night the figure of Maroni is lighted by electricity. The interior of each of the 4 corner towers is cylindrical, 17 feet in diameter, and granite steps lead from the basement to the roof.

The Temple contains many stones symbolical of the different conditions of mankind. Around the base are earthstones. Above these are moonstones, showing the moon in its various phases, and emblematic of terrestrial glory. Still higher than these are sunstones, typical of celestial or the highest glory of the heavens. There are also star-stones representing the glory of the stars. On the west tower is the *ursa major*, pointing to the polar star, and indicating that there is a fixed guide for fallen mankind in their attempt to return to God.

Cloudstones, and others of a symbolic nature also appear. The main entrance for the Mormons is at the east, and under the main tower. The baptismal font that was the great feature of the Temple at Nauvoo is reproduced on a more elaborate scale in the west end of the basement. The font is of bronze, and it rests on the backs of 12 life-size bronze oxen, 8 looking to the east, 3 to the west, 3 to the north, and 3 to the south. It is a reproduction, as nearly as possible, of the font in the Temple at Jerusalem. The room containing it is 57 feet long, and 35 feet wide. The floor is tiled with polished marble, and the ceiling is cerulean. Adjoining alcoves are provided with marble bath tubs for use in anointing with oil. Another large room in the northeast corner of the basement is a lecture hall, known as the Creation room, where the story of the creation of the earth is told as a preparation for the other ceremonies. Still another large room, in the southeast corner, represents the Garden of Eden when it was occupied by Adam and Eve. Both nature and art have been used to make the decoration of this room effective.

Above the basement, three floors occupy the space to the roof. In the basement the knobs, hinges, etc., are of brass. On the first floor they are of plated gold; on the second, of plated silver; on the third, of old silver; and on the fourth, of old bronze. All this hardware was made to order in the design of the beehive, the emblem of the Mormon Church, the clasped hands, and the motto "Holiness to the Lord." The wood used for the interior is quartered oak. Exquisitely wrought basins of onyx are placed at frequent intervals throughout the building. The upper floor contains an assembly room 120 feet long, 80 feet wide, and 36 feet

high. The room has a seating capacity, including the gallery, of nearly 3,000. This was the room in which the dedicatory services were held, two relays of worshipers being in attendance each day for over two weeks. The eastern part of the room is for the Melchisedec priesthood, representing the higher, or spiritual affairs. The west is for the Aaronic priesthood, representing temporal affairs. This division of labor and honors is copied from the arrangement of the original Temple at Kirtland.

The first and second floors are of the most interest. They contain rooms of various sizes for the ceremonial of the Mormon Church. In these rooms, blue and white, relieved with gold, are the prevailing colors. One of them, on the first floor, represents the glory of the celestial kingdom. Another, the celestial room, is the grandest and most beautiful in the Temple. Four massive Corinthian columns break the broad expanse of wall on both the north side and the south. The spaces between the columns form niches for busts of Brigham Young and others prominent in the Church. A statue of the Virgin adorns the west end of the room; and the east end is embellished with two paintings, one of the hill Cumorah, and the other of the place in Missouri where Adam is said to have built an altar after he left the Garden of Eden, which Garden the Mormons believe was in North America. The color of the room is terra cotta, and the ceiling is decorated with bunches of fruits and flowers. In direct contrast to this room is another representing the Garden of Eden after the Fall, where all the elements are discordant and the animal life begins to show signs of contention. An alcove to the south of the celestial room is known as the sealing room, wherein marriages are solemnized.

The Temple is lighted with electricity and heated with hot water. There are two elevators in the western end, but they are little used because the rise of the granite steps is easy and graceful. Estimates of the cost of the Temple vary materially, but it was probably not far from \$12,000,000.

It has a beautiful site, standing on the highest ground in the city and overlooking the business portion south of it, while it is itself overlooked by the mountains on the north. The Tabernacle, with its great turtlelike roof, is west of the Temple on the same terrace.

Amnesty.—A petition for general amnesty for all the convicted polygamists was sent to President Harrison in February. Eleven of them were granted amnesty in October, but the general grant to all who had not broken the law since Nov. 1, 1890, was not proclaimed till Jan. 4, 1893. The preamble of the proclamation recited the facts that the president of the Church had issued a manifesto proclaiming the purpose of said Church no longer to sanction the practice of polygamous marriages, and calling upon all members and adherents of said Church to obey the laws of the United States in reference to said subject matter; that by petition, the officials of said Church, pledging the membership thereof to a faithful obedience to the laws against plural marriage and unlawful cohabitation, had applied for the amnesty, in which they were joined by a large number of influential non-Mormons of the

Territory; and that the Utah Commission had recommended it.

Silver Demonstrations.—A mass meeting in favor of silver coinage was held at Salt Lake City in July. The Governor presided. Great enthusiasm was shown, and resolutions were passed strongly in favor of a law fully restoring silver, and recommending that "as many as possible of the earnest men of Utah go to Washington to urge such legislation upon Senators and Representatives, and that special invitations be sent to all surrounding States and Territories to unite with Utah in this appeal and to send delegates to Washington instructed to organize with and to work in concert with all silver delegations to go enlisted for the war."

On July 29 a mass meeting of women was held at the same place and a memorial to Congress was adopted.

On April 10 the Ogden Chamber of Commerce passed resolutions implying a boycott on the insurance companies of Hartford, and especially the Connecticut Mutual Life, because the Board of Trade of that city had adopted a preamble and resolutions, "composed of false statements, designed to injure and oppress the cause of silver, and mislead the masses of the people."

Political.—The time of holding the general and municipal elections has been changed to the Tuesday following the first Monday in November. Members of the Territorial Legislature were elected Nov. 7, and the results showed large Republican gains. In Salt Lake City the "combined Citizens' and Independent Citizens' ticket" was generally successful, and in Ogden the Republican ticket.

The Trans-Mississippi Congress.—The fifth meeting of this congress was held in Ogden, beginning April 24. The object is the discussion of questions affecting the West that may be

subjects of legislation at Washington. Among resolutions adopted were the following:

Whereas, The overproduction of either gold or silver has been wholly impossible in the past and is entirely improbable in the future; and,

Whereas, The drawing apart of the two metals in relative value is due solely to legislation; and,

Whereas, In the opinion of the Trans-Mississippi Congress, the Congress of the United States of America can, without the co-operation of any foreign power, restore silver to its ancient and rightful place as a money metal of the world, and keep it there; and,

Whereas, What the whole world requires and must have is more standard money to redeem with, and not promises to pay in gold, the purchasing power of which has been constantly increasing, therefore, be it

Resolved, That we demand that the Congress of the United States immediately reopen the mints of our country to the free and unlimited coinage of both gold and silver on equal terms, at the present ratio of sixteen to one, and that the Government use the coins of both metals without discrimination.

Other resolutions favored the admission as States of New Mexico, Arizona, Utah, and Oklahoma; approved the Geary law; favored asking Congress for appropriations for finishing the work on Oakland harbor, constructing a deep-water harbor near Los Angeles, completing the opening of the lower Columbia, improving the upper Columbia, the Snake, the Cœur d'Alene, Kootenai, and Arkansas rivers, constructing a fresh-water harbor on Puget Sound, restoring the navigability of Texas rivers, making a deep-water harbor at Rope's Pass, on Corpus Christi Bay, and carrying out the provisions of the Caminetti hydraulic mining law in California. The silver free coinage resolution was passed by a vote of 230 to 40. There was a vote of 71 against recommending Utah for Statehood, but 162 were in favor of it. It was opposed by members of the liberal party of Utah.

V

VENEZUELA, a federal republic in South America. Under the Constitution of June 21, 1893, the Senate is composed of 27 members, 3 from each State, who must be natives of the country and thirty years of age, and who serve four years. The Chamber of Deputies has 63 members, 1 for every 35,000 inhabitants, who are elected for four years by direct universal suffrage in each State. The President and the Council of Government are elected for four years.

Gen. Crespo was proclaimed President on Oct. 10, 1892. In the beginning of 1893 the Federal Council was composed of the following members: Minister of Foreign Affairs, P. E. Rojas; Minister of the Interior and Justice, L. Colina; Minister of Finance, M. Pietri; Minister of War and Marine, Gen. Guzman Alvarez; Minister of Posts and Telegraphs, L. Baptista; Minister of Public Works, M. Tebar; Minister of Public Instruction, S. Gandolphy.

The area of Venezuela is 593,943 square miles, and the population, according to the census of 1891, is 2,323,527, of whom 1,137,139 are males and 1,186,368 females.

Finances.—In the budget of 1890-'91 the revenue is figured out to be 35,976,000 bolivars, or francs, and the expenditure the same sum.

The debt on Jan. 1, 1891, amounted to 110,938,687 bolivars. Under the decisions of the claims commission appointed in pursuance of treaties made in 1885 and 1888 Venezuela was bound to pay to the United States \$824,301 in 10 annual installments with interest payable semi-annually. In 1893 the Venezuelan Government was in default for one installment and a year's interest. An arrangement was sought in 1893 for the settlement of the claim of the Venezuela Steam Transportation Company, an American corporation, for the value of property destroyed twenty years before, amounting with interest to about \$750,000.

Political Events.—The delay of the Crespo Government in establishing a constitutional régime, and the arbitrary acts of revenge and confiscation committed against the adherents of Palacio, brought the country again to the verge of revolution. An edict of confiscation was issued against the real and personal property of

Palacio, Villegas, Urdaneta, Mendoza, and Pulida, and their followers. This was modified by placing an embargo upon the property of all the executive, judicial, and military officers and the Senators and Deputies who formed part of the usurping Government of those ex-dictators and holding them all liable *pro rata* for the war debt incurred by Crespo. All sales and mortgages made by the Continuistas during the usurpation were declared null and void. In carrying out these decrees against a large number of the wealthiest citizens, the Government made many enemies and provoked revolts in Los Andes, Bolivar, and other States.

Elections for a Constituent Assembly were held in March. While they were in progress the Crespistas, accusing Pietri and some of his colleagues of jobbery and corruption, brought about an entire reconstruction of the Cabinet. The new ministers were: Gen. Guerra, War; Unda, Finance; Barrios, Education; Aveledo, Agriculture; Vallenilla, Governor of the Federal District. The Assembly met on May 2 and elaborated a new Constitution. Gen. Crespo was elected President until a regular election should be held under the Constitution. He appointed the following Cabinet: Gen. Nufiez, Prime Minister; Dr. Rojas, Minister of Foreign Affairs; Colina, Minister of the Interior; Bustamante, Minister of Agriculture, Posts, and Telegraphs; Gen. Raimon Guerra, Minister of War; Gen. Velutini, Minister of Finance. The Assembly authorized a general amnesty, which was forthwith proclaimed by Gen. Crespo. The embargo was removed from the property of the adherents of the late Government. A conspiracy against the new Government was discovered and thwarted, and extraordinary precautions were taken to prevent the landing of arms. Many of the Government party did not like a provision of the new Constitution that permits Senators or Deputies to hold ministerial, administrative, or military appointments and also makes functionaries of the Government and officers of the army eligible to the Federal, State, or municipal legislatures. Another clause, which takes the control of public lands and mines from the individual States and vests it in the Federal Government, was obnoxious to the opponents of centralism, some of whom were in favor of the proposition made by Andueza Palacio to revive the 20 States of the old Federation. Nevertheless, when the election took place in October, Crespo was elected President for the constitutional term beginning Feb. 20, 1894.

VERMONT, a New England State, admitted to the Union March 4, 1791; area, 9,565 square miles. The population, according to each decennial census since admission, was 154,465 in 1800; 217,895 in 1810; 235,966 in 1820; 280,652 in 1830; 291,948 in 1840; 314,120 in 1850; 315,098 in 1860; 330,551 in 1870; 332,286 in 1880; and 332,422 in 1890. Capital, Montpelier.

Government.—The following were the State officers during the year: Governor, Levi K. Fuller, Republican; Lieutenant-Governor, F. S. Stranahan; Secretary of State and Insurance Commissioner, Chauncey W. Brownell, Jr.; Treasurer, Henry F. Field; Auditor, Frank D. Hale; Superintendent of Education, M. S. Stone; Inspector of Finance, Savings Banks, and Trust

Companies, W. H. Du Bois; Railroad Commissioners, Samuel E. Pingree, Amory Davison, Leon G. Bagley; Chief Judge of the Supreme Court, Jonathan Ross; Assistant Judges, John W. Rowell, Russell S. Taft, James M. Tyler, Loveland Munson, Henry R. Start, and L. H. Thompson.

Valuations.—The total grand list of the State for 1893, as reported to the Secretary of State, was \$1,760,518, an increase of \$8,768.42 over 1892. The city of Burlington has a taxable list of \$112,471.63, and Rutland, \$82,852.62. The taxable polls numbered 82,526, being 113 fewer than in 1892.

Soldiers' Home.—On Aug. 1 there were 60 inmates of this institution. Its total yearly income is about \$18,000. The State appropriates \$8,000 annually, and the annual contribution from the General Government is about \$5,000. The institution is at Bennington.

Insurance.—The report of the insurance commissioners for 1892 shows the number of licensed companies to be 50, from 46 of which reports have been received. These received premiums amounting to \$669,087, paying losses of \$501,252. The ratio of losses paid to premiums was 77 per cent., which, with an average expense ratio of 35 per cent., shows a loss to the companies. Thirteen casualty companies took premiums of \$92,598, paying losses of \$51,004.

Industrial.—Reports received by the State Board of Agriculture show that there were 376 unoccupied farms in the State at the beginning of the year. Addison County had 15; Bennington, 26; Caledonia, 48; Essex, 7; Lamoille, 7; Orange, 57; Orleans, 22; Rutland, 18; Washington, 29; Windham, 94; Windsor, 53. Returns to the same board show that during 1892 the sum of \$818,500 was invested in the State in new industries or in enlarging plants already in operation. These new industries give employment to 1,100 persons. Creameries were established in 12 towns, cheese factories in 3, and electric-light plants at Bristol and Hartford. The granite and marble industries show many new firms, while corn-canning factories, shingle mills, machine shops, bobbin and spool mills are found in the list. At Westmore the Willoughby Lake Improvement Company was organized with a capital of \$60,000 for building a summer resort. At Ludlow \$60,000 was invested in a new woolen mill. Burlington and Montpelier have invested \$13,000 in brass foundries. Burlington also has a match factory, with \$15,000 invested, and a new lumber company with a capital of \$25,000. Milton has a new plant for the manufacture of excelsior; Moretown, a chair-stock mill; Randolph, a screen factory; Barton, a ladies' underwear manufactory. Brattleboro and Bethel have enlarged their jelly and shoe manufactories, and Bennington has increased the capacity of its hosiery and jersey mill.

VIRGINIA, a Southern State, one of the original thirteen, ratified the Constitution June 25, 1788; area, 42,450 square miles. The population, according to each decennial census, was 747,610 in 1790; 880,200 in 1800; 974,600 in 1810; 1,065,116 in 1820; 1,211,405 in 1830; 1,239,797 in 1840; 1,421,661 in 1850; 1,596,318 in 1860; 1,225,163 in 1870; 1,512,565 in 1880; and 1,655,980 in 1890. Capital, Richmond.

Government.—The following were the State officers during the year: Governor, Philip W. McKinney, Democrat; Lieutenant-Governor, J. Hoge Tyler; Secretary of State, H. W. Flournoy; Auditor, Morton Marye; Second Auditor, Josiah Ryland; Treasurer, A. W. Harman; Attorney-General, R. Taylor Scott; Adjutant-General, James McDonald; Superintendent of Public Instruction, John E. Massil; Commissioner of Agriculture, Thomas Whitehead; Railroad Commissioner, James C. Hill; President of the Court of Appeals, L. L. Lewis.

Legislative Session.—The General Assembly of 1893-'94 was organized Dec. 6, 1893, and remained in session until Dec. 20, when it adjourned to Jan. 1, 1894. The chief work finished was in deciding the claims of candidates for office. Charges had been made that the Hon. Thomas S. Martin, candidate for the United States senatorship for the full term beginning March 4, 1895, during the last campaign for members of the Legislature, had illegally used money and men in the work of providing for his own election to the United States Senate. A joint legislative committee of seven members devoted several days to the hearing of testimony, and finally reported that there was no evidence to show that any improper methods or means had been used by any candidate for the United States Senate. The General Assembly adopted the report and elected Mr. Martin. Gen. Eppa Hunton was elected to the United States Senate for the short term. Gov. McKinney sent to the Legislature a special message on the subject of taxation.

Finances.—The annual report of the State Treasurer for the fiscal year ending Sept. 30, 1893, shows a balance on hand Oct. 1, 1892, of \$1,117,205.73; received in the fiscal year 1892-'93, \$3,297,576.56; disbursed 1892-'93, \$3,750,973.40; balance on hand Oct. 2, 1893, \$663,808.89. The total balance in the treasury to the credit of the several funds on Oct. 2, 1893, was \$992,435.50.

The annual interest on the public debt is \$554,947.44; on the college fund, \$146,067.32; making a total of \$701,014.76. The interest paid out last year was \$1,205,542.07, or \$504,527.31 more than the interest account for the coming year. This difference is due to the fact that last year two years' interest was paid on the public debt, it having accumulated during the process of debt settlement. The two years' interest payment also accounts for the discrepancy between the balances of 1892 and 1893.

The securities deposited with the Treasurer by foreign insurance companies amounted in 1893 to \$2,098,236.37. From the statement of the Virginia debt made by the Second Auditor, showing the amount funded, and the principal and interest unfunded, under the act of Feb. 20, 1892, the following is taken: Owing to delay by the distribution commission in fixing the rate of funding, a manuscript bond for the sum of \$16,350,860 was issued, on which the State duly paid interest for two years, to and including July 1, 1893, amounting to \$654,394.40. The manuscript bond being surrendered to the State July 21, 1893, it was canceled and filed in the treasury, and new engraved bonds were issued in lieu thereof, as follow: Issued to Bondholder's Committee, \$16,359,860; to Commissioners of the

Sinking Fund, \$281,508.49; ready to be issued to Commissioners of the Sinking Fund when called for, \$20,771.68; total issued and ready to be issued, \$16,662,135.17. The coupon bonds under this act are transferable to registered bonds, but the latter are not transferable to coupon bonds. The amount of each class outstanding Oct. 1, 1893, is as follows: Coupon bonds, \$16,121,000; registered bonds, \$515,100; fractional certificates, which can be converted into either coupon or registered bonds, \$5,263.49; total, \$16,641,363.49. The debt unfunded is as follows: Principal, bonds, and certificates issued under acts passed prior to April 17, 1861, under act of March 2, 1866, also sterling certificates issued under act of March 30, 1871, computed as funded at two thirds on account of the deduction of West Virginia's proportion, \$545,933.01; consols, act of March 30, 1871, \$1,015,493.30; peelers, act of March 7, 1872, \$38,781.11; ten-forties, act of March 28, 1879, \$309,900; total, \$1,910,107.42. From this deduct two thirds of old bonds held by United States Government and various internal improvement companies, which are not fundable, \$431,957.33, and there is to be funded \$1,478,150.09. Interest tax-receivable coupons (estimated), \$1,000,000; interest on consols and peelers, registered, \$105,676.75; two-third interest on old bonds, \$892,209.11; black scrip, \$104,491.62; total, \$2,102,377.38. Deduct two thirds of interest due United States and words of internal improvement, \$688,164.43; also interest due more than thirty years which never will be called for, \$250,000; and unfunded interest will amount to \$1,164,212.95; unfunded principal is \$1,478,150.09; total, \$2,642,363.04. This amount, funded at the same rate with that already funded, will yield, in new bonds, \$1,798,047.16, which, with bonds already issued and to be issued, \$16,662,127.10, gives the total debt under the act of Feb. 20, 1892, as \$18,460,174.26. But it is almost certain that the issue will never exceed \$18,250,000, so that the following may be considered a correct statement of Virginia's debt: Principal—outstanding bonds under act of Feb. 14, 1892, \$6,331,581.40; under act of Feb. 20, 1892, \$18,250,000; total, \$24,581,581.40. Annual interest—3 per cent. on \$6,331,581.40 is \$189,923.60; 2 per cent. on \$18,250,000 is \$365,000; total, \$554,923.60.

Taxation.—The value of real estate owned by whites is \$296,371,055; of personal property, \$90,373,044; the value of real estate owned by colored people is \$9,829,583; of personal property, \$3,465,370; total real-estate valuation, \$306,200,658; total valuation of personal property, \$93,838,414. Total tax assessed against whites, \$1,824,153.74; against colored people, \$172,391.28; total tax, \$1,996,545.02. The live stock numbers 1,779,629 head, and is valued at \$21,863,600. The receipts from the oyster tax for the year were \$32,865, an excess of \$17,865 over the receipts of 1892.

Railroads.—As there was no construction of roads in 1893, the total mileage in the State is 3,862.64 miles. The gross earnings were \$31,765,330.81, an excess of \$2,062,304.22 over 1892. The amount of tax paid by the railroads was \$508,702.98, which is about one sixth of all the taxes collected.

Internal Revenue.—The report of the Commissioner of Internal Revenue shows that during the fiscal year Virginia paid \$2,912,548.28. She is the largest exporting tobacco State in the Union. There were operated during the last fiscal year 217 cigar factories, which used 2,300,459 pounds of tobacco for the production of cigars, and 1,974,275 for the manufacture of cigarettes. The number of cigars produced was 130,836,613, and the number of cigarettes was 750,814,752. The amount of license tax paid was \$687,297.74, of which amount \$296,766.71 was derived from liquor licenses.

Education.—The biennial report of the Superintendent of Public Instruction covers the years 1892 and 1893, but only figures for the latter year will be cited, as the statistical summaries indicate that as regards the essential elements of growth the year 1893 is without a parallel in Virginia. There are in the State 6,636 school-houses, having a seating capacity for white pupils of 254,158, for colored pupils of 112,646. In these schools 5,868 white teachers and 2,064 colored teachers are employed. The school population (census of 1890) is 377,595 white and 275,831 colored; the number of pupils enrolled during the year was 227,696 white and 120,775 colored; the average daily attendance was 130,398 white and 63,745 colored. The total expenditure for all purposes was \$1,798,157.90, an increase of \$107,692.17 over the expenditure in 1892. The estimated value of school property is \$2,763,584.97; 261 school buildings were erected during 1893, and 238 during 1892.

At the University of Virginia the total attendance was 547, against 516 in 1892. During 1893 the Fayerweather Gymnasium, erected at a cost of about \$31,000, was completed. The funds for this building and its equipment were derived from the Fayerweather bequest of \$100,000. A new dispensary also has been constructed.

At the Virginia Military Institute the whole number of cadets on the rolls was 220. At this institute the average annual expense for a cadet, exclusive of his outfit, is \$530.

The Virginia Agricultural and Mechanical College instructed 116 students during the year, 61 more than in 1892. The cost of the session for each pupil here is estimated at \$175.70, of which \$30 is for tuition. Provision is made by statute for the education of 200 young men from the State, who are not required to pay tuition. As far as is possible, all work about the college is done by students, who receive pay for their services, but the demand for work far exceeds the supply. The cost of maintaining the college during 1893 was \$55,943.93.

At the State Female Normal School tuition is free to 135 students, who bind themselves to teach two years in the public schools of the State if opportunity be afforded them. To those who do not so pledge, tuition is given at a nominal cost of \$30 a session. The charge for board and washing for each session of nine months is \$120. During 1893 the number of students in attendance was 225.

William and Mary College instructed 119 students who pledged themselves to teach two years in the public schools, and who therefore were received at the rates fixed by statute: Ten dollars a month, to include tuition, board, wash-

ing, fuel, and lights. Eighty-five other students attended during the year.

The Medical College of Virginia was attended by 101 students. For a session of nine months the expense is \$90.

The Institution for the Deaf and Dumb and the Blind maintained 92 deaf and dumb and 52 blind pupils. The benefits of the school proper are free to residents of the State, who are required to pay only for board and clothing, \$130.

The annual appropriation is \$35,000.

The Virginia Normal and Collegiate Institute enrolled 323 students. Expenses for regular students for board, rent, and tuition for the session of eight months is \$60. State students are charged \$40.

The Hampton Normal and Agricultural Institute gave instruction to 954 boys and girls—white, colored, and Indian—at an outlay for current expenses of \$82,453.83. Of this amount the State contributed \$16,329.36. Of the graduates of this institution during the twenty-two years of its existence, 2,000 have become teachers, and have instructed 129,475 pupils.

The Miller Manual-Labor School has an endowment of \$1,300,000. The students for the year were 93 girls and 157 boys.

Insane Asylums.—In the Western Lunatic Asylum 779 patients were treated during the year. The cost of maintenance was \$100,848.84. For new buildings \$30,859.47 was expended, and the total disbursement was \$146,649.13. The patients made 7,284 new garments during the year. The Eastern Lunatic Asylum had 466 patients under treatment during the year. The disbursement for all expenses was \$78,442.53. The Central Lunatic Asylum added a building for female patients, which accommodates 105. For this purpose the Legislature appropriated \$20,000. The entire cost of maintaining the institution during the year was \$74,140.29. The cost *per capita* was \$102.26, the lowest of all asylums in this country. The Southwestern Lunatic Asylum expended \$44,373.74 in caring for 367 patients.

Penitentiary.—The expense of keeping 1,107 prisoners (being the daily average) for twelve months was \$77,384.87. This amount, and an additional sum of \$28,677.75, was received from hire of convicts. Prisoners received for overwork during the year \$9,238.71. On Oct. 1, 1,391 prisoners remained in the Penitentiary, 72 of whom were employed on public works. In 1893 the criminal expenses of the State were \$521,552.54.

Agriculture.—The report of the Commissioner of Agriculture shows these items: Amount of appropriation, \$10,000; expended, \$7,585.72; balance, \$2,414.28. Amount received from fertilizer control, \$8,800; expended for carrying out provisions of fertilizer act, \$6,481.35; balance, \$2,318.65. The fertilizer act is designed to regulate the sale and purity of commercial fertilizers, the consumption of which has increased from 57,600 tons in 1887 to over 150,000 tons in 1893. The average yield per acre for 1893 was: Wheat, 96; corn, 83; oats, 96; hay, 70; cotton, 86; tobacco, 86; Irish potatoes, 81; sweet potatoes, 81; peanuts, 78. The truck crops of Norfolk realized more than \$5,000,000, and gave employment to 10,000 to 20,000 people. In response

to petitions signed by 401 farmers, one farmer's institute was held.

Boundary.—The circuit court of the United States decided that Maryland dredgers have no right to take oysters from the beds of either Potomac river or Potomac Sound, these being within the jurisdiction of Virginia. A survey of the waters of the State, to be used in determining her boundary line, is nearly completed.

Riot in Roanoke.—On the evening of Sept. 20 a mob attempted to take from the authorities a negro who was accused of assaulting a white woman. The militia was called out to guard the jail, and the negro, in charge of the police, was taken to the woods for concealment. When the mob attacked the doors of the jail the militia fired upon it from the windows; the firing was returned by the mob, and 18 persons were killed and 27 wounded; among the latter was the Mayor. When the officers in charge of the negro attempted to return with him to the jail, he was taken from them and hanged to the nearest tree, and his body was riddled with bullets. A placard was placed upon his body with the inscription: "Mayor Trout's Friend." The feeling against the authorities, who had tried to protect the negro, and against the militia was very strong. The mayor and others were compelled to leave town, and, to satisfy the mob, a committee of citizens suspended from office Mayor

Trout, City-Sergeant Traynhaw, Chief of Police Terry, and Special-Officer McMorris, the city remaining in charge of President Buckner, of the City Council. On the 25th the committee asked all the fugitives to return.

Jefferson Davis.—On May 27 the body of Jefferson Davis was removed from the tomb in New Orleans, where it has remained since his death, to Memorial Hall, in that city, where it lay in state until the next day. It was thence removed to Richmond, the funeral train stopping only at Beauvoir, at Montgomery, Greenville, S. C., Atlanta, Ga., and at Raleigh, N. C. Reaching Richmond early Wednesday morning, May 31, the body was taken to the Capitol, where it lay in state through the day, and in the evening it was interred with impressive ceremonies in Hollywood Cemetery, in the grave selected by Mrs. Davis. The cedar coffin in which the body originally was placed was reinclosed in the vault from which it had been taken, which then was closed with a marble slab bearing a facsimile of the autograph of Mr. Davis.

Confederate Monuments.—At Charlottesville, on June 7, a monument to the memory of the 1,080 soldiers whose remains are buried in the cemetery at that place was unveiled with appropriate ceremonies, and in Portsmouth, on June 15, a monument to the Confederate dead in Portsmouth was dedicated.

W

WASHINGTON, a Pacific coast State, admitted to the Union Nov. 11, 1889; area, 69,180 square miles; population, according to the census of 1890, 849,890. Capital, Olympia.

Government.—The following were the State officers during the year: Governor, John H. McGraw, Republican; Lieutenant-Governor, Frank H. Luce; Secretary of State, James H. Price; Treasurer, Ozro A. Bowen; Auditor, Laban R. Grimes; Attorney-General, William C. Jones; Commissioner of Public Lands, William T. Forrest; Superintendent of Public Instruction, Charles W. Bean; State Printer, Oliver C. White; Adjutant-General, R. G. O'Brien; Chief Justice, R. O. Dunbar; Associate Justices, T. L. Stiles, J. P. Hoyt, T. J. Anders, Elmon Scott.

Finances.—The receipts of the State treasury for the year ended Dec. 31, 1893, on general fund account were \$755,153.40, and the disbursements \$745,541.88, leaving a balance of \$9,611.52. The appropriations from the general fund for the current fiscal term of two years ending March 31, 1895, amount to \$2,199,011.08, including \$244,761.08 for deficiencies; and the unpaid warrants drawn in pursuance of such appropriations aggregated, on Dec. 31, 1893, \$983,618.76, bearing 8 per cent. interest. To meet this floating indebtedness, the State Treasurer estimates the revenue receivable under the general tax levy of 1893 at \$835,175, and from liquor licenses, insurance taxes, and fees paid State officers, at \$150,000, for the fiscal term. The receipts on military-fund account during 1893 were \$54,573.70, and the disbursements \$53,077.61. The State's bonded indebtedness is

\$300,000, and bears 3½ per cent. interest. The balance in the bond interest fund, Dec. 31, 1893, was \$6,685.72.

Assessments and Taxes.—The State Board of Equalization fixed the total valuation of property for 1893 at \$283,110,082, divided as follows: Real, \$227,201,096; personal, \$41,165,560; railroad track, \$14,743,376. On this valuation the board made the following levies: General fund, \$835,175; military fund, \$56,622; bond interest fund, \$14,155.50. Railroad track was divided for assessment purposes into six classes, and valued at from \$5.300 per mile for first-class to \$1,000 per mile for sixth class.

Legislative Session.—The third Legislature began its regular session on Jan. 9, and adjourned on March 9. The railroad legislation of the session was important. Under a peculiar provision of the Washington Constitution any bill disapproved by the Governor after the adjournment of the Legislature passing it must be submitted to the next succeeding Legislature, with a statement of the reasons of the Governor for such disapproval: whereupon such succeeding Legislature is required to vote upon the question whether the bill shall pass, notwithstanding the objections of the Governor. In accordance with this constitutional provision, a measure known as the Wasson bill, passed by the Legislature of 1891 and vetoed by Gov. Laughton, was brought before the Legislature of 1893, and was passed over the veto. The bill provided that no greater charge should be made by railroad companies for carrying wheat, barley, flour, or other mill stuffs, potatoes, melons, or hay than 85 per cent. of the rates charged

for carrying such commodities on Dec. 1, 1890; and that not more than \$5 a ton should be charged for carrying the commodities enumerated for a distance of 500 miles or less. An increase of the maximum rates on other freight, as they existed on Dec. 1, 1890, was forbidden. A forfeiture of compensation in each case of violation, and a fine not exceeding \$500 for each offense, were provided as penalties. Later in the session another measure on the subject of freight rates, known as the Anderson bill, became a subject of contention. It provided for a further decrease of rates. A compromise resulted in its passage, with a provision that no rate greater than 85 per cent. of the rates in effect on Jan. 8, 1893, should be charged for carrying wheat, barley, flour, or other mill stuffs, flaxseed, rye, oats, potatoes, or hay, and that no greater rate than \$4.75 a ton should be charged for carrying the products enumerated in car-load lots for a distance of 500 miles or less. The penalties were made the same as those of the other act. These laws were designed to benefit the farmers of eastern Washington. A bill was passed declaring a failure by a railroad company to build fences along its right of way *prima facie* evidence of negligence in actions for injuries to stock by its trains.

There was also passed over the veto of Gov. Laughton a bill, first passed by the preceding Legislature, making it unlawful for any person or corporation to organize or employ an armed body of men in the State for any purpose whatever, which was aimed particularly against the use of such armed bodies in case of strikes. The act provides that any person violating it shall be punished by a fine of not less than \$1,000, nor more than \$5,000, and in a like sum for each day he shall continue to offend after being once fined. Provision is also made for the imprisonment of offenders against the act, and for the forfeiture of arms and equipments to the State.

A new State land policy was adopted by the enactment of a law placing all school and public lands, tide lands, and harbor-line areas under the supervision of a board of State land commissioners, which superseded other boards. A controversy arose as to the regularity of the passage of the bill providing for this board, and the Attorney-General declined to approve the official bond of one of the commissioners, on the ground that the bill signed by the Governor was not the same as the one passed by the Legislature, and that the constitutional requirements had not been observed in its introduction or its progress. Application was made to the Supreme Court for a writ of mandamus requiring the Attorney-General to approve the bond, which was granted, the Court holding that the enrolled bill of an act of the Legislature, which is duly signed by the presiding officers of both Houses and otherwise appears fair upon its face, is conclusive evidence of the regularity of all proceedings necessary for its proper enactment in conformity with the constitutional provisions.

A fractional section of common-school land near Seattle was set apart as a new site for the State University, and an appropriation of \$150,000 was made for the erection of a building thereon. The following appropriations were also made for the erection of public buildings: For

additions to insane hospitals, \$120,000; addition to Reform School, \$15,000; addition to Penitentiary, \$50,000; new buildings for the Agricultural College, \$70,000; Ellensburg Normal School, \$60,000. Appropriations for normal-school buildings, aggregating \$90,000, were vetoed. •

Other acts of the session were as follow:

Enabling cities and towns to validate warrants and other evidences of indebtedness issued in excess of legal authority.

Authorizing cities and towns to purchase and construct water works, systems of sewerage, and gas and electric-light plants.

Regulating fishing in Columbia river and Puget Sound.

To quiet possession and confirm titles to land.

Providing for the appointment of police matrons in cities.

Fixing the legal rate of interest at 8 per cent.

Relative to assignments for the benefit of creditors.

For the prevention of cruelty to children, animals, and birds.

Providing that makers of wills may deposit the same with clerks of the superior court for safe keeping.

For the relief of indigent soldiers, sailors, and marines of the civil and Mexican wars.

Making an additional appropriation of \$55,000 for the State's World's Fair exhibit.

Prohibiting the sale, purchase, and manufacture of cigarettes and cigarette paper.

Regulating the practice of dentistry.

Providing for garnishment proceedings.

To secure secrecy in the transmission of telegraph and telephone messages.

Granting a bounty of one half cent per pound for the production and manufacture of sugar in the State.

Providing for the construction, repair, and improvement of public roads.

To protect salmon and other food fishes in Puget Sound.

Prohibiting divorced persons from contracting marriage within the period in which an appeal from the decree may be taken.

Requiring assignments by insolvents to be for the benefit of all the creditors.

Authorizing the Governor to remove from office all officers appointed by him not liable to impeachment.

For the punishment of bank officers for receiving deposits for a bank while knowing such bank to be insolvent.

Regulating the practice of pharmacy.

For the construction of a State road across the Cascade Mountains by way of the pass north of Mount Baker.

The duty devolved upon the Legislature to choose a Senator in Congress to succeed John B. Allen, whose term expired on March 4; but after a contest that lasted throughout the session the Legislature failed to elect. The membership of the joint convention consisted of 75 Republicans, 28 Democrats, and 9 Populists. A Republican senatorial caucus was held, but as some of the Republican members failed to attend it, there was not a sufficient representation present to constitute a majority of the Legislature. John B. Allen was nominated by the caucus to succeed himself, but the party contest was necessarily left unsettled, and was carried into the Legislature. On the first ballot in the Houses, Allen received 49 votes, 7 less than a majority. The Republicans opposed to Allen, together with one Democrat, voted for George Turner, his vote being 26. Chauncey W. Griggs, the Democratic nominee, received 27, and Govnor Teats, the

Populist candidate, 9. On the third day of the balloting in joint convention, there being few changes from the first ballot, a rule was adopted that thereafter but two ballots should be taken each day. The Allen and Turner members, with some few exceptions, voted to the end as they did on the first ballot. Allen's highest vote was 52 and Turner's 28. The last ballot, the hundred and first, stood as follows: Allen 50, Turner 24, Griggs 8, Shaw 15, Van Patten 9. After the adjournment of the Legislature Gov. McGraw appointed John B. Allen as United States Senator to fill the vacancy caused by the expiration of Allen's term and the failure to elect his successor. Mr. Allen presented his credentials to the Senate, but he was refused a seat, the ground being taken that the Governor of a State has no authority to appoint in the case of a vacancy occurring in the senatorial representation of such State while its Legislature is in session which such Legislature fails to fill.

State Capitol.—The Legislature authorized the erection of a State capitol, limiting the cost to one million dollars, and making an appropriation thereof of \$500,000 out of a capitol building fund. This fund is to derive its revenue from sales of lands granted to the State by the United States for public buildings at the State capital, amounting to 132,000 acres. Provision has been made for the sale of these lands at public auction in tracts of 160 acres, not more than 10,000 acres to be disposed of at any one sale. But little progress was made during the year toward construction. A commission was appointed to carry out the purposes of the building act; this board called for the submission of plans by architects, and received 187 in response, but at the close of the year a selection had not been made.

Education.—During 1893 the State apportioned among the various school districts \$104,169, which sum was mainly derived from interest on the permanent school fund and interest on deferred payments for the common-school lands that have been sold by the State. The permanent school fund on Dec. 31 amounted to \$630,276.46, of which \$508,000 was invested in county and school-district bonds. In November the Supreme Court decided that school-district bonds were municipal bonds within the meaning of the provision of the Constitution regulating the management of the permanent school fund, and that therefore the moneys of that fund might be invested in such school bonds. The last biennial report of the Superintendent of Public Instruction presented the following statistics: Number of districts, 1,720; schoolhouses, 1,515; graded schools, 180; children of school age, 106,130; pupils enrolled, 78,819; average monthly salary paid male teachers, \$52.29; average monthly salary paid female teachers, \$42.16.

Charities.—The number of patients in the Western Washington Hospital for the insane on Dec. 31, 1893, was 430, a net increase of 67 since Sept. 30, 1892. The attendance at the School for Defective Youth on Dec. 31, 1893, was 100, 50 being deaf and dumb, 10 blind, and 40 feeble-minded.

State Lands.—According to a report of the Commissioner of Public Lands, the lands selected by the State under the grants contained in the

act of Congress providing for the admission of the State into the Union amounted on Dec. 31, 1893, to 432,124.15 acres. Of these selections, the United States district land offices had accepted applications for 341,358.74 acres, and the Secretary of the Interior had approved entries of 27,463.82 acres. The grants aggregate 622,000 acres. In a case involving the right of the Seattle and Montana Railway Company to extend its road across State property at Seattle, the Supreme Court decided that a railway corporation had no authority to condemn a right of way across tide lands owned by the State.

Harbor Improvements.—Under the stimulating influence of an act passed by the last Legislature, relating to the excavation of water ways, plans have been projected for improvement of Puget Sound harbors on a large scale. The act provides for the reclamation of tide lands by the excavation of water ways through them, and the raising of the lands bordering on such water ways by placing on them the excavated dirt. The Commissioner of Public Lands is empowered to make contracts for such improvements, the cost thereof to be a first lien upon the land reclaimed. Those who expect to engage in this work are planning to provide large fresh-water basins for ocean vessels at Seattle, Tacoma, and Olympia, that at the first-named city to be secured by the construction of a canal connecting the sound with Lake Washington, while it is proposed to build at Tacoma a broad embankment that will dam the waters of the Puyallup at the point where that river flows into the sound. For Olympia an enterprise similar to the one suggested for Tacoma is proposed for holding the waters of Des Chutes river. The cost of these three projects is estimated by their promoters at \$10,000,000, but it is claimed that the enhanced value of the tide lands affected will be much more than the expense of making the improvements.

Railroads.—Railroad construction in the State in 1893 was limited to the completion of the Great Northern transcontinental line and of the Northern Pacific branch from Chehalis to South Bend, the extension of the Spokane and Northern to the Canadian border, and the construction by the Castle Rock Coal Company of a branch 6 miles long to connect its coal mines with the Northern Pacific Railroad. The total increase of mileage was 41.9. The Great Northern company finished track laying on its line to the coast early in January, but the road was not opened to through passenger business until June. The completion of this line was very gratifying to the people of the State, as it was expected to cause a reduction of transcontinental freight rates, and when it was formally opened to traffic Seattle recognized the event by a celebration, of which a coal palace was a conspicuous feature. The total number of miles of railroad in the State is 2,824.

Minerals.—Several discoveries were made during the year in the mining districts of gold, silver, lead, copper, and zinc ores, but the work of development was not pushed vigorously. There was some activity in the Cle Elum, Peshastin, and Swank camps, and in the Okanogan country a few new stamp mills and a concentrator were put in. The greatest amount of development work thus far carried on in any of the min-

ing districts has been done in the Monte Cristo region. This district, which is 3 by 5 miles in extent, is traversed by two great glacial gorges running parallel and uniting at their western ends. A railroad 50 miles long has been built into this district at a cost of nearly \$40,000 a mile, and the mining companies in the district have an aggregate capital of \$25,000,000. An interesting discovery of gold quartz was made within the limits of the city of Tacoma on Dec. 5. The latest estimate of the coal area of the State is 1,000,000 acres, extending into 18 counties, and discoveries of new veins have been frequent. A new coal mine is being opened at Roslyn, the shaft of which will be 18 by 30 feet across, and 620 feet from the surface to the coal. The total output of coal for the year is estimated at 1,500,000 tons, about two thirds of which was shipped out of the State. Aluminum has been discovered in Kittitas County and graphite in Lewis County, and companies were organized during the year for working these beds.

Fisheries.—An estimate of the fishing catch for the year, aside from the cannery business, is as follows: Salmon, 8,000,000 pounds; sturgeon, 6,000,000 pounds; halibut, 1,500,000 pounds; herring and perch, 1,500,000 pounds; smelt, 1,000,000 pounds; codfish, 220,000 pounds; carp and catfish, 100,000 pounds; oysters, 20,000 sacks; clams, 10,000 sacks. The value of this product is placed at \$915,500.

Lumber.—On Dec. 31, 1893, there were in the State 227 sawmills, 300 shingle mills, and 73 sash-and-door and other wood-working factories. The amount invested in the lumber business was estimated at \$25,000,000, and the value of the annual product at \$15,000,000. The output of the mills for 1893 was: Lumber (feet), 1,164,425,880; lath, 436,716,000; shingles, 1,883,868,750. The foreign shipments from Dec. 1, 1892, to Nov. 30, 1893, were: Lumber (feet), 88,717,658; shingles, 1,757,000. The domestic shipments went to 33 States and Territories, and were: Lumber (feet), 364,316,523; shingles, 918,300,000. The number of acres of standing timber in the State is 23,588,512, estimated to contain 410,333,335,000 feet of lumber.

Pacific Forestry Reserve.—President Harrison in January withdrew from entry a tract in the Cascade mountains 35 by 40 miles in extent, including Mount Tacoma, and it is expected that Congress will make the withdrawal permanent by creating a national park within the limits of the tract, to be known as the Pacific Forestry Reserve. It embraces some of the wildest and most picturesque scenery in the world. At its center, clustering about Mount Tacoma, are great glacial fields, and in its lower altitudes are beautiful valleys, numerous cataracts, and gigantic forests. Recent calculations have caused the announcement that Mount Tacoma approximates 15,000 feet in height. Its altitude has heretofore been placed at 14,444 feet.

Road Convention.—The subject of road improvement has become one of leading consideration throughout the State. The Legislature dealt with it, but not altogether satisfactorily, and at the suggestion of the State Press Association Gov. McGraw called a State road convention to meet at Olympia on Dec. 19. The meeting, which was well attended, disapproved a proposition

favoring the bonding of the State for \$5,000,000 for road and irrigation purposes. Among the resolutions adopted by the convention were the following:

That Congress should donate to the State 25 per cent. of all moneys realized from the sale of public lands in the State, to be used for the purpose of building and maintaining roads.

That moneys accruing to the State from the sale of tide lands be appropriated for road purposes.

That the width of wagon tires be regulated by law, and that the use of wide tires be encouraged by offering rebates of taxes.

That all prisoners convicted of felonies or misdemeanors be required to work public roads.

That Congress should grant to each of the new States 500,000 acres of public land for road-improvement purposes.

That an inheritance tax should be levied on the estates of persons who shall die possessed of property of the value of \$1,000 or more, the revenue arising therefrom to be paid into a State road fund.

That a chair of road engineering should be established in the State Agricultural College.

Provision was made for submitting to the next Legislature a series of bills embodying the views of the convention.

Horticulture.—The fruit-raising interest is growing into one of great importance. During the year a great impetus was given to prune growing, and many orchards of that fruit were set out in the western half of the State. In the Yakima country and other sections east of the Cascades peach raising has become very successful, and on lands reclaimed by irrigation in the central portion of the State very thrifty orchards are growing. Apple, pear, cherry, and plum orchards also bear heavily in various sections.

WEST INDIES. an archipelago dividing the Caribbean Sea from the Atlantic Ocean. Except the Spanish colonies (see CUBA and PUERTO RICO) and Hayti (see HAYTI and SANTO DOMINGO), the islands are possessions of Great Britain, France, Denmark, and the Netherlands.

British Colonies.—The British islands are Jamaica, the Bahamas, Barbadoes, Trinidad, and the Leeward and Windward Islands.

Jamaica has a Legislative Assembly of 18 members, one half of them elective, and the rest official or nominated by the Governor. The present Governor is Sir Henry Arthur Blake. The area of the island is 4,193 square miles. The population in 1891 was 639,491, of whom 488,624 were pure blacks, 121,955 colored or half-breeds, 14,692 white, 10,116 East Indian, 481 Chinese, and 3,623 not specified. Of the East Indians, 7,223 were indentured laborers. The number of marriages in 1891 was 3,560; of births, 24,507; of deaths, 16,040. The military force is 1,434 men. The revenue for 1891 was £779,000, and the expenditure £782,000. The debt is £1,520,000. There are 89 miles of railroad and 695 miles of telegraph. The number of dispatches wired in eighteen months ending March 31, 1891, was 159,499. The post-office in the year 1891-'92 carried 2,760,617 letters. The chief products are sugar, rum, coffee, fruits, sweet potatoes, pimento, cattle, and cinchona. The imports in 1891 were valued at £1,760,000, and the exports at £1,722.

Barbadoes has a Representative Assembly of 24 elected members. The present Governor is Sir J. S. Hay. The island has an area of 166

square miles, and in 1891 had 182,306 inhabitants. It is the headquarters for the British troops, which numbered 85 officers and 854 men in 1893. The chief exports are sugar, rum, and fish. The total value of the imports in 1891 was £1,067,617, and of the exports £814,254. The revenue of the colony was £163,905, and the expenditure £176,800.

Trinidad has a Legislative Council of 8 official and 10 nominated members. The Governor is Sir F. Napier Broome. The area of the island is 1,754 square miles. Population, 200,038. The dependent island of Tobago has an area of 114 square miles and 18,387 inhabitants. There were 6,657 births, 5,612 deaths, and 986 marriages in Trinidad in 1890. The cultivated products are sugar, cacao, coffee, yams and sweet potatoes, and cocoanuts. There is a considerable export of asphaltum obtained from a pitch lake in the center of the island. The labor of Indian coolies is much utilized, and in 1890 there were 4,921 immigrants, mostly of that class. The revenue for 1891 was £488,000; expenditure, £490,000. The imports were valued at £2,097,000, and the exports at £2,059,000. The imports of Tobago were £23,945, and the exports £24,241 in value.

The Leeward Islands have a Federal Legislative Council of 10 elected and 10 nominated members. The Governor is Sir William Frederick Haynes Smith. The island of Antigua produces sugar and pineapples; Montserrat, sugar and lime juice; St. Kitt's and Nevis, sugar; Anguilla, cattle, pineapples, vegetables, and salt; the Virgin Islands, sugar and cotton; Dominica, sugar, fruit, cacao, and timber. The total area of the islands is 701 square miles. The population in 1891 was 127,723, comprising 99,333 pure blacks, 28,320 colored, and 5,070 white people. The financial and commercial statistics for 1891 are as follow:

ISLANDS.	Revenue.	Expenditure.	Imports.	Exports.
Virgin Islands.	£1,512,000	£2,219,000	£4,444,000	£4,683,000
St. Christopher.	83,207	45,221	161,105	187,455
Nevis				
Anguilla				
Antigua	49,504	47,309	167,110	157,468
Montserrat	6,526	7,303	25,846	24,389
Dominica	21,588	24,937	60,750	88,910

The Bahamas have a Representative Assembly elected by popular suffrage, restricted by a property qualification. Sir Ambrose Shea is the Governor. The area is 5,390 square miles, and the population at the last census was 47,565. There were 1,900 births and 1,052 deaths in 1891. The products are sisal fiber, sponges, cotton, fruit, shells, pearls, and ambergris. The export of pineapples in 1891 was valued at £44,842; of preserved pineapples, £3,793; of sponges, £58,682. The total imports were valued at £190,670, and the total exports at £128,010. The revenue was £52,813, and the expenditure £55,804. The sisal-hemp industry has been developed chiefly by the efforts of the present Governor, who went to the Bahamas in 1887. The sisal aloe grew abundantly in the islands, and was a troublesome weed, known as the *pila*, which the farmers dug up and burned with other underbrush in order to clear the land for oranges and pineapples.

The sisal aloe (*Agave rigida*), known also by the Spanish name of *jeniquen* and the Indian names of *mayguay* and *sacqui*, is a native of Yucatan, where it is now also grown for its fiber, but does not reach the perfection of the Bahama product, which is equal to the best Manila hemp. There are more than 12,000 acres planted, and the cultivation is rapidly increasing. The Government has granted a bounty to producers, and has limited for ten years the amount of land to be granted by the Crown for this purpose. The price of the land is fixed at \$4 an acre, except to the colored people, to whom the Government offers a 10-acre plot for each family for the nominal price of 5s. an acre, payable out of the first crop. Few of them have availed themselves of this opportunity to become independent. The best of the hemp goes to London, where it brings £30 to £40 a ton, while the cost of production is about £12. The minimum yield has been about half a ton of cleaned fiber an acre. The plants are set out in rows 6 feet apart each way. The leaves are old enough to cut in four years, and the plants continue productive for twelve or fifteen years, at the end of which each sends up a quantity of suckers from its roots and a spike from the middle, 12 or 15 feet high, bearing a large number of flowers. The seeds of these are scattered over the ground, and the plants that spring from them are set out in nurseries and transplanted to the field at the end of a year, when their leaves are 12 or 15 inches long. The leaves of the grown plants that are suitable for cutting are from 3 to 6 feet in length. The plantations are continually renewed by rows of young plants set out between the yielding plants. The leaves may be cut continuously throughout the year when they have attained maturity, but are usually harvested twice a year. The leaves are crushed between steel rollers, which leave the greenish-white fiber, constituting about 5 per cent. of the bulk. The fiber is dipped in sea water and then bleached white, in two days, by the action of the air and sunlight, sorted according to length and quality, tied into knots, and pressed into bales of 400 or 500 pounds.

The Windward Islands are divided into three Crown colonies, under the general direction of a Governor. Sir Charles Bruce at the present time, who resides at St. George's, Grenada. The area of Grenada and the Grenadines is 166 square miles, and the population is 54,063; the area of St. Lucia is 237 square miles, and the population is 42,220; the area of St. Vincent is 147 square miles, and the population is 41,054. The chief products of Grenada are cacao, cotton, and spices; of St. Lucia, sugar, cacao, and logwood; of St. Vincent, sugar, rum, cacao, spices, and logwood. The statistics of finances and commerce for 1891 are as follow:

ISLANDS.	Revenue.	Expenditure.	Imports.	Exports.
Grenada	£24,018	£24,450	£176,927	£236,643
St. Lucia	49,326	58,906	222,178	181,723
St. Vincent	27,649	23,517	97,589	95,679

The Danish Antilles.—The islands of St. Croix, St. Thomas, and St. John form a Danish colony. St. Croix has an area of 74 square miles and 19,783 inhabitants; St. Thomas, an area of 23 square miles and 12,019 inhabitants; and St.

John, an area of 21 square miles and 984 inhabitants. The people are mostly negroes who raise the sugar-cane on their own land, and the principal exports are raw sugar.

The Dutch Antilles.—The islands of Curaçao, Bonaire, Aruba, a part of St. Martin, St. Eustache, and Saba form the Dutch colony of Curaçao, which is administered by a Governor with the assistance of a Colonial Council of 8 official and 8 appointed members. The Governor in 1893 was Dr. C. A. H. Barge. The area of the island of Curaçao is 210, of Aruba 95, of Bonaire 69, of St. Martin 17, of Saba 5, and of St. Eustache 7 square miles. The population of Curaçao in 1892 was 27,493, of Aruba 7,888, of Bonaire 4,053, of St. Martin 4,023, of Saba 1,926, and of St. Eustache 1,633. The budget of the colony for 1893 was expected to balance at 694,696 guilders. The imports in 1890 were valued at 8,733,917 guilders. The principal products are Indian corn, beans, cattle, salt, and lime.

French Colonies.—The island of Martinique has an area of 380 square miles and 175,863 inhabitants; Guadeloupe, with its dependencies, has an area of 720 square miles and 165,154 inhabitants. Each island has its Governor and elective council, and is represented in the French Parliament by a Senator and 2 Deputies. Martinique produces sugar, manioc, sweet potatoes, and bananas, and to a smaller extent coffee, cacao, and tobacco. The products of Guadeloupe are sugar, coffee, cacao, vanilla, spices, manioc, woods, bananas, sweet potatoes, rice, and to some extent cotton, ramie fiber, and tobacco. The budget of Martinique for 1890 makes the receipts 3,993,000 francs and the expenditures the same, and that of Guadeloupe makes them balance at 5,940,000 francs. The imports of Martinique in 1890 were valued at 30,261,000 francs; exports of domestic produce, 20,714,000 francs; imports of Guadeloupe, 23,249,000 francs; exports of domestic produce, 20,672,000 francs. D. Moracchini is the present Governor of Martinique, and L. H. Nouet Governor of Guadeloupe. A railroad 15 miles long is under construction in Guadeloupe, for which annual subventions will be paid for seventy-five years, at the end of which it becomes the property of the colony.

WEST VIRGINIA, a Southern State, admitted to the Union June 19, 1863; area, 24,780 square miles. The population, according to each decennial census since admission, was 442,014 in 1870; 618,457 in 1880; and 762,749 in 1890. Capital, Charleston.

Government.—The following were the State officers during the year: Governor, A. B. Fleming, Democrat, succeeded on March 4 by William A. McCorkle, Democrat; Secretary of State, William A. Ohley, succeeded by W. E. Chilton; Treasurer, William G. Thompson, succeeded by John M. Rowan; Auditor, Patrick F. Duffey, succeeded by I. V. Johnson; Attorney-General, Alfred Caldwell, succeeded by Thomas S. Riley; Superintendent of Free Schools, Benjamin S. Morgan, succeeded by Virgil A. Lewis; President of the Supreme Court, John W. English; Judges, Henry Brannon, Homer A. Holt, and Marmaduke A. Dent.

Legislative Sessions.—The regular biennial session of the Legislature began on Jan. 10, and expired, by limitation, on Feb. 24. On Jan. 24

Hon. Johnson F. Camden, Democrat, was elected a United States Senator for the unexpired term of Senator John E. Kenna, who died in Washington on Jan. 11. The vote was as follows: Senate—Camden 20, Erwin Maxwell, Republican, 4; House—Camden 39, Maxwell 29, M. W. Burgess, Populist, 1. On the same day United States Senator Charles J. Faulkner was re-elected for the full term of six years, the vote being: Senate—Faulkner 20, Stephen B. Elkins, Republican, 4; House—Faulkner 39, Elkins 28, O. D. Hill, Populist, 2. The legislation of the session includes an act reducing the State tax levy for general purposes 5 cents on each \$100 of valuation, and increasing the levy for school purposes by the same amount. By this change three sevenths of the entire amount of taxes collected by the State will hereafter be devoted to the support of public schools. Suitable provision was made for the purchase or erection of an executive mansion. The employment of non-residents to perform police duty in the State, or otherwise to assist in the execution of its laws, was forbidden. Other acts of the session were:

Revising the laws relating to the management of the Penitentiary.

Providing for depositing in the Auditor's office certain records, books, documents, and papers relating to land titles procured and to be procured from the State of Virginia, and making the same a part of the public records of the Auditor's office, and providing how the same or copies thereof, and certificates based thereon, may be used as evidence.

Making it a misdemeanor, punishable by a fine not to exceed \$200 and imprisonment not to exceed one year, to rent a house to be used as a house of ill fame, and constituting each day a separate offense, annulling all leases or contracts for the renting of such houses, and providing for a fine, not to exceed \$25, for living or loitering in such places.

For the prevention of cruelty to children, and providing for their care and maintenance in certain cases. This act allows children to be taken by trustees of orphans' homes and other such institutions when their parents are not giving them proper care and attention, upon the order of the judge of the circuit court of the county in which the child resides.

Providing for the erection in the national Capitol of a statue of Senator John E. Kenna.

Creating 3 mining districts in the State instead of 2.

Revising the laws concerning the sale of lands for the benefit of the school fund.

Authorizing fidelity and guarantee companies of other States to transact surety business in this State.

Amending the Australian election law by requiring the districts to be laid off into precincts, and prohibiting any person from voting outside the precinct in which he resides.

At the expiration of this session, on Feb. 24, the regular appropriation bills had not been passed. The Governor, therefore, at once called a special session, to meet on Feb. 25, specifying in his call no business except the consideration of appropriations. At this session the regular appropriation bills, which were pending at the close of the previous session, were carried through, and an adjournment reached March 8.

Charities.—At the Insane Hospital, in Weston, there were 936 patients in February. The buildings for the new hospital at Spencer were practically completed during the year. The sum of \$122,000 had been expended thereon up to February, and at that time two of the three buildings were ready for furnishing.

WISCONSIN, a Western State, admitted to the Union May 29, 1848; area, 56,040 square miles. The population, according to each decennial census since admission, was: 305,391 in 1850; 775,881 in 1860; 1,054,670 in 1870; 1,315,497 in 1880; and 1,688,880 in 1890. Capital, Madison.

Government.—The following were the State officers during the year: Governor, George W. Peck, Democrat; Lieutenant-Governor, Charles Jonas; Secretary of State, T. J. Cunningham; Treasurer, John Hunner; Attorney-General, J. L. O'Connor; Superintendent of Public Instruction, O. E. Wells; Insurance Commissioner, W. M. Root; Railroad Commissioner, T. Thompson.

With the exception of the annual treasury report, all Wisconsin reports are made biennially. The latest reports, with the exception of the joint report of the Secretary of State and State Treasurer, therefore cover only the years 1891 and 1892.

Finances.—The following is a statement of the amounts received and paid out by the State Treasurer during the year ending Sept. 30, 1893, the total amount received being \$2,249,542.96: On hand Sept. 30, 1892, \$640,228.12; received from railroad companies, \$1,156,260.75; telegraph companies, \$9,657.62; telephone companies, \$11,705.71; sleeping-car companies, \$1,193.04; from counties for maintaining insane, \$139,723.27; from counties for Industrial School for Boys, \$8,511.81; fifth normal school, \$9,985.59; free high schools, \$49,927.95; suit tax from counties, \$6,599; peddler licenses, \$15,228.17; insurance licenses, \$122,651.27; from United States for Veterans' Home, \$14,711.94; from loan and trust companies, \$1,025.85; from boom companies, \$4,187.66; from office fees, \$39,828.36; from interest on general fund, \$12,569.08; from all other sources, \$5,587.77. There was paid out from the general fund \$1,786,501.55, as follows: For salaries and permanent appropriations, \$195,438.42; for charitable and penal institutions, \$368,247.84; for legislative expenses, including second special session, 1892, \$154,508.95; for clerk hire, \$56,174.53; for labor about Capitol, \$49,067.96; for special appropriations, \$213,920.98; for National Guard, \$32,459.79; for other expenses, \$416,178.40; balance in treasury, \$463,041.41. The investment of trust funds is as follows: School fund, \$3,380,672.28, an increase of \$22,169.78 during the year; university fund, \$229,922; Agricultural College fund, \$299,438.04; Normal School fund, \$1,811,325.11; drainage fund, \$2,316; total, \$5,723,673.43.

The total receipts during the year from these and other trust funds was \$1,958,559.12; the disbursements were \$1,843,244.32; balance on hand Sept. 30, 1892, \$163,341.37; balance in treasury Sept. 30, 1893, \$278,656.17.

The bonded debt of the State, Jan. 1, 1893, was represented by certificates of indebtedness as follows: To the school fund, \$1,563,700; to the Normal School fund, \$515,700; to the University fund, \$111,000; to the Agricultural College fund, \$60,600; total bonded debt, \$2,251,000.

Taxation.—The following figures are taken from the report of the Secretary of State for the years 1891 and 1892. The value of all the personal property in 1891 was \$107,120,453; of city

and village lots, \$218,193,453; of other lands, \$265,590,938; total valuation, \$591,604,854. The value of all personal property in 1892 was \$119,724,782; of city and village lots, \$203,405,727; of other lands, \$380,869,491; total valuation, \$664,000,000. The tax assessed in 1891 by the State Board of Assessors was \$1,328,983.96, of which \$988,886.15 was the State tax of 1-58511059 mill on each dollar of valuation. The tax assessed in 1891 by the county boards of supervisors and the town assessors on counties, towns, cities, and villages was \$13,665,343.20. The tax assessed by the State Board of Assessors in 1892 was \$1,319,943.22, of which \$1,018,720 was the State tax of 1-557676 mill on each dollar of valuation. The amount of internal-revenue tax for 1893 was \$4,228,740.35, an increase of \$434,041 over 1892.

Banks.—The number of State banks organized under the banking law doing business July 4, 1892, was 110, with an aggregate capital of \$6,286,000.

Education.—The report of the State Superintendent of Instruction to Jan. 1, 1893, shows the number of children of school age during the last year covered by the report to be 618,884; number enrolled in public schools, 362,064; number of free high schools, 182; number of pupils enrolled therein, 11,022; number of schoolhouses, 6,570; number of teachers, 12,355. The receipts for common schools were \$6,150,722.83; the expenditures, \$4,326,327.54. The receipts for normal schools, in which 2,397 pupils were instructed, were \$181,836.13, all of which, except \$47,422.75 paid for buildings, was expended for their maintenance.

A tract of land adjacent to the State University was bought during 1893 for its use, the Legislature appropriating \$25,000 for the purpose. A building for the College of Law was completed at a cost of \$75,000, and also an armory building, at a cost of \$100,000. This building contains the largest college gymnasium in America. In January Charles Kendall Adams was inaugurated president of the university. The number of students enrolled during 1893 was 1,287, an increase of 195 over 1892. The income of the university during 1892 was \$268,510.60; the disbursements were \$268,187.02, of which \$36,656.74 was for the expenses of the experiment station.

The Dairy School accommodates only 100 students, and many applications for admission are refused. The school uses 45,000 pounds of milk daily. After the separation of the cream from the milk in butter making, the skim milk is sterilized and returned to the farm from which it was received. The annual dairy products of the State are valued at about \$30,000,000. The number of pounds of butter made in 1891 is reported as 25,791,513; of cheese, 54,365,220.

Township Libraries.—The township library law was passed in 1887. It authorizes each town treasurer to withhold 10 cents for each person of school age to secure a library fund, which is to be expended by the town clerk, under certain restrictions, for a township library. The books of this library are distributed among the several districts of the township in proportion to the amount withheld from each. The

number of town libraries in 1892 was 295, containing 54,265 books. The number of district libraries in 1892 obtained by local taxation was 6,270, with a total of 28,579 books.

Charitable and Penal Institutions.—The State Hospital for the Insane received from the State in 1893 \$113,333.44; in 1892, \$96,436.14; and in 1891, \$101,167.47.

The Northern Hospital for the Insane received in 1893 \$114,093.59; in 1892, \$118,894.81; and in 1891, \$120,583.23. For the maintenance of the chronic insane in county hospitals \$244,239.18 was expended in 1893, \$218,793.55 in 1892, and \$207,877.85 in 1891.

The Wisconsin School for the Deaf enrolled 179 pupils in 1893, and received from the general fund \$39,209, and from the school fund \$9,085. It received from the general fund in 1892 \$36,489.58 and in 1891 \$36,317.67.

The Wisconsin School for the Blind enrolled 82 pupils in 1893, and received \$33,209.39 from the general fund and \$2,949 from the school fund. It received from the general fund in 1892, \$26,119.04, and \$23,090.85 in 1891.

The Industrial School for Boys enrolled 361 pupils in 1893, and received from the general fund \$51,800.30, and from the school fund \$2,241.66. It received from the general fund in 1893 \$47,584.75, and \$63,449.45 in 1891.

The Industrial School for Girls received special appropriations of \$2,500 in 1892, and \$4,500 in 1891.

The State Public School enrolled 288 pupils, receiving from the general fund in 1893 \$40,720.09, and from the school fund \$1,829.65. It received in 1892 from the general fund \$47,584.75, and \$42,493.50 in 1891.

The proportion of State-Prison expenses paid from the general fund in 1893 was \$10,813.68; in 1892, \$7,465.12; in 1891, \$6,982.04.

The number cared for in the Milwaukee Soldiers' Home during the year ending June 30, 1893, was 3,266; the number of deaths was 139; the number that received a pension was 1,846, who draw \$270,524.15 annually. The number of arrests made for drunkenness during the first six months of the year was 1,070, against 2,116 for the same period in 1892. The profits of farm work were \$20,801.73. The report of the board of managers speaks highly of the Keeley gold-cure.

To the Veterans' Home, at Waupaca, an appropriation for maintenance of \$27,037.72 was made in 1892, and of \$23,441.15 in 1891. Special appropriations of \$28,552.50 and \$17,000 were made in 1892 and 1891.

Live Stock.—The number of horses in the State at the beginning of the year was 377,607; of neat cattle, 1,151,535; of mules and asses, 4,341; of swine, 570,937; of sheep and lambs, 807,714. The total valuation of live stock was \$38,723,955.

Agriculture.—The number of acres devoted to the various products in 1892 was as follows: To wheat, 707,457; corn, 960,640; oats, 1,538,449; barley, 500,971; rye, 250,813; potatoes, 160,852; root crops, 97,492; cranberries, 3,032; strawberries, 1,282; apples, 98,560, with 1,131,077 bearing trees. The receipts of the 66 agricultural societies amounted to \$209,455.88, exclusive of two legislative appropriations to the

amount of \$5,669.10. The expenditures were \$212,024.05.

War Records.—The compilation of the individual history of the Wisconsin troops in the civil war was completed in 1893. The cost of getting the records ready for the printer was about \$140,000. The number of pensions paid in Wisconsin is 27,612; their amount is \$4,378,353.50.

Treasury Interest Cases.—During the year \$370,074.51 was paid back to the State by ex-State Treasurers. For many years prior to 1891 it had been the custom of the Treasurers to deposit State moneys in various banks and to receive interest on the public funds thus loaned or deposited. For this interest they did not account to the State, but converted it to their own uses. In 1891 suit was brought against all Treasurers during the past twenty years and their sureties to recover such interest received by them, with interest thereon. In a test case in the circuit court judgment in the State's favor was given in February, 1892, and this decision was sustained by the Supreme Court in January, 1893, and, in accordance with it, repayment was made.

Legislative Session.—The Legislature met on Jan. 12, 1893, and, after a session of fourteen weeks, adjourned on April 21. Among the bills passed were the following:

Providing an appropriation of \$1,000 for the establishment of a free circulating library, to be printed in embossed type, for the use of all blind citizens of the State.

To provide a uniform system of certification of teachers, and to give the graduates of leading educational institutions the right to teach without the necessity of taking examination by a county or city superintendent.

To grant to the city of Milwaukee a certain portion of submerged land lying along and adjacent to the shore of Lake Michigan, on the eastern frontage of the city of Milwaukee, for a public park and boulevard.

Authorizing cities to issue corporate bonds for the purpose of paying the expenses of building and maintaining bridges.

Authorizing courts to transact business on legal holidays.

To abolish days of grace.

To prevent oppressive garnishments and depriving debtors of their exemption rights.

To provide for the payment into the county treasury of the funds received by justices of the peace and other magistrates.

Appointing a committee to locate the position of Wisconsin troops at Chickamauga.

To authorize church corporations to form fire-insurance companies to insure church property.

Amending the statutes providing for the use of gifts and bequests to cemetery associations.

To protect associations and trade unions in their labels and trade-marks.

To limit the number of terms to which a person may be eligible to the office of county treasurer.

Creating a State Board of Arbitration to act in case of labor disputes, and appropriating \$2,500 therefor.

To provide for a revision of the school code of Wisconsin.

A general fish bill was passed, which provides, among other things, that waters that have been stocked by the State shall be open to the public for fishing, and debars any persons from securing exclusive rights therein by leasing or purchasing the land on either side of the stream. This opens all trout preserves to the public.

Over the several road bills there was strong fighting; the result was the passage of a good bill giving full supervision of the making and management of all roads to the town board of each town, and decreeing that all road taxes shall be paid in money.

The Hon. John L. Mitchell (Democrat), on the thirty-first ballot, was elected to the United States Senate for six years from March 3, 1893.

WORLD'S COLUMBIAN EXPOSITION.

In the issues of the "Annual Cyclopædia" for 1891 and 1892 the history of previous expositions and the story of the details that led to the World's Fair in Chicago were given. The actual history of its life remains to be told.

Officers.—The World's Columbian Commission consisted of the following: Thomas W. Palmer, president; T. M. Waller, M. H. de Young, D. V. Penn, G. W. Allen, and A. B. Andrews, vice-presidents; John T. Dickinson, secretary; and James A. McKenzie, vice-chairman of the Executive Committee, together with 8 commissioners at large and 2 commissioners from each of the States and Territories, including Alaska and the District of Columbia. The World's Columbian Exposition Association was officered as follows: Harlow N. Higinbotham, president; F. W. Peck, R. A. Waller, vice-presidents; D. O. Edmunds, secretary; S. A. Crawford, assistant secretary; A. F. Seeberger, treasurer; W. K. Ackerman, auditor; and C. V. Barrington, assistant auditor. The director-general was George R. Davis, who had the supervision of the following departments: A. Agriculture, Food and Food Products, Farming Machinery and Appliances; chief, W. I. Buchanan. B. Viticulture, Horticulture, and Floriculture; chief, J. M. Samuels. C. Live Stock, Domestic and Wild Animals; chief (acting), W. I. Buchanan. D. Fish, Fisheries, Fish Products, and Apparatus of Fishing; chief, J. W. Pollins. E. Mines, Mining, and Metallurgy; chief, Frederick J. V. Skiff. F. Machinery; chief, L. W. Robinson. G. Transportation Exhibits, Railways, Vessels, and Vehicles; chief, Willard A. Smith. H. Manufactures; chief, James Allison. J. Electricity and Electrical Appliances; chief, J. P. Barrett. K. Fine Arts (Pictorial, Plastic, and Decorative); chief, Halsey C. Ives. L. Liberal Arts (Education, Engineering, Public Works, Architecture, Music, and the Drama); chief, S. H. Peabody. M. Ethnology, Archæology, Progress of Labor and Invention (Isolated and Collective Exhibits); chief, Frederick W. Putnam. N. Forestry and Forest Products; chief (acting), W. I. Buchanan. O. Publicity and Promotion; chief, Moses P. Handy. P. Foreign Affairs; chief, Walker Fearn. Director of the works, Daniel H. Burnham. The Board of Lady Managers was similar in organization to the National Commission, and consisted as follows: Mrs. Potter Palmer, president; Mrs. Susan G. Cooke, secretary; together with 9 vice-presidents, 8 lady managers at large, and 2 from each State and Territory.

Opening Exercises.—The 1st of May in Chicago began with fog, mist, rain, and mud; but as the day advanced the weather cleared, until the elements added their share to the universal enthusiasm at the opening of the World's Columbian Exposition.

The day had been made a legal holiday, and

from early morning until ten o'clock masses of humanity thronged the thoroughfares leading to the grounds, and patiently awaited the opening of the gates. Meanwhile the usual procession was organizing, under the command of Major T. A. Baldwin, U. S. A., and in time it started, led by the police. Then came two companies of the Seventh Cavalry, U. S. A., followed by the Chicago Hussars and the mounted Troop A of the Illinois National Guard. Next came carriages with distinguished personages—national and local commissioners, the director-general, the director of works, President Davis of the Columbian Commission, and President Higinbotham of the Columbian Exposition Company, the Vice-President of the United States, the members of the Cabinet, the Duke of Veragua, the Duchess of Veragua (escorted by Mrs. Potter Palmer), Gen. Miles, of the United States army, Admiral Gherardi, Mayor Harrison, and many others. They entered the grounds at the western gate of the Midway Plaisance, and passed strange groups of Africans, Algerians, Japanese, Laplanders, Moors, and Persians, each of which welcomed the advancing procession in a manner peculiar to his own nationality. Slowly they advanced past the Woman's Building and the beautiful structure devoted to the Mines and Mining to the west door of the Administration Building. Two platoons of cavalry had meanwhile drawn up between this structure and the terminal station, and between these passed the guests as fast as they alighted from their carriages. From the eastern entrance the procession moved toward the platform, extending across the whole front of the Administration Building, from which the formal ceremonies were to be conducted. From the center of the platform proper radiated a special stand, and upon this were chairs for the President and Vice President of the United States, the Duke of Veragua and his party, and the higher national and local officers of the fair. Immediately in the rear were the members of the diplomatic corps, and right and left were minor officials and guests, while last of all was the orchestra.

Had the weather been more propitious, the ceremonies would have begun with a chorus by 1,000 voices; but this feature was dispensed with, and the actual exercises began with a "Columbian March," composed for the occasion by John K. Paine, and rendered by an orchestra of 600 pieces, led by Theodore Thomas. Then the blind chaplain of the United States Senate, the Rev. William H. Milburn, was led to the front of the platform by his adopted daughter, Miss Gertrude Gemlev, and led the assembly in prayer. Immediately following was the reading, by Miss Jessie Couthoi, of William A. Croffut's poem, entitled "The Prophecy," in which he told of how

Sadly Columbus watched the nascent morn,
and saw a

Prophetic picture of the land he sought,
closing with

He saw exalted Ignorance under ban.
Though panoplied in force, since Time began;
And Science, consecrated, lead the van,
The providence of man.

THE ADMINISTRATION BUILDING AND ELECTRIC FOUNTAINS AT NIGHT.

The picture came and paled and passed away,
And then he said to Pinzon, in the gloom:
"Now, Martin, to thy waiting helm again.
Haste to the Pinta; westward keep her prow,
For I have had a vision full of light.
Keep her prow westward, in the sunset's wake,
From this hour hence, and let no man look back."

After the overture from "Rienzi" had been rendered by the orchestra, the director-general, George R. Davis, told the history of the growth and development of the exposition, closing with—

The grand concerted illustration of modern progress which is here presented—encouragement of art, of science, of commerce—has necessitated an expenditure, including the outlay of our exhibitors, largely in excess of \$100,000,000. We have given it our constant thought, our most devoted service, our best energy, and now, in this central city of this great republic, on the continent discovered by Columbus, whose distinguished descendants are present as the honored guests of our nation, it only remains for you, Mr. President, if in your opinion the exposition here presented is commensurate in dignity with what the world should expect of our great country, to direct that it shall be opened to the public, and when you touch this magic key the ponderous machinery will start in its revolutions, and the activities of the exposition will begin.

Mr. Cleveland's remarks were brief. He said:

I am here to join my fellow-citizens in the congratulations which befit this occasion. Surrounded by the stupendous results of American enterprise and activity, and in view of magnificent evidences of American skill and intelligence, we need not fear that these congratulations will be exaggerated. We stand to-day in the presence of the oldest nations of the world and point to the great achievements we here exhibit, asking no allowance on the score of youth.

It is an exalted mission in which we and our guests from other lands are engaged as we co-operate in the inauguration of an enterprise devoted to human enlightenment; and in the undertaking we here enter upon we exemplify in the noblest sense the brotherhood of nations.

Let us hold fast to the meaning that underlies this ceremony, and let us not lose the impressiveness of this moment. As by a touch the machinery that gives life to this vast exposition is now set in motion, so at the same instant let our hopes and aspirations awaken forces which in all time to come shall influence the welfare, the dignity, and the freedom of mankind.

As the applause that greeted this address died away a moment of breathless silence ensued, during which the President touched the electric button that set in motion the machinery that was distributed throughout the fair. As the wheel of the great engine that furnished the power to the exposition began to revolve, the audience burst into a loud cheer. The electric fountains sent their streams of water skyward, and the beautiful MacMonnies fountain became alive with pulsating motion as the floods from many open-

ings rushed to and fro about its basin, seeking their way to the Court of Honor, where the great status of the Republic slowly emerged from its drapery, revealing all the stately majesty of its pure golden beauty, while from the lake beyond came loud sounds of cannon fired by the United States vessels, and the buildings answered the echoes by flashing back the thousands of brilliant-colored flags and streamers that had been

STATUE OF COLUMBUS.

unfurled. Then the sun came out and cast a warm influence over all the beauty of the scene. The "Hallelujah Chorus" of the orchestra gave way to "America," and the great World's Columbian Exposition began its actual existence.

A luncheon followed in the Administration Building, after which the President and his party were taken to the Manufactures and Liberal Arts Building, where they were received by the commissioners of the various foreign governments. The electric launches carried the party over the water ways, while gayly decorated gondolas served as escorts. A moment was spent at the Woman's Building, and finally a landing was made at the Agricultural Building, then a drive along the esplanade beside the lake to the Art Building, which was hastily inspected, and then by a special train away and back to Washington.

Of almost equal interest were the opening exercises of the Woman's Building. These began shortly before 3 o'clock in the afternoon with

the rendering of the grand march by Jean Ingeborg von Bronsart, of Weimar, Germany; then followed a prayer by Miss Ida Hullin. Miss Frances Elliott, of London, gave a dramatic overture, after which Mrs. Potter Palmer made the formal address of the occasion. A jubilate, by Mrs. H. H. A. Beach, of Boston, was the next feature of the programme. Addresses were then

upper portion of the shield which is attached to the nail near the head. Mrs. Potter Palmer, President of the Board of Lady Managers, drove the nail of gold home with a silver hammer. An attendance of 128,965 was registered.

The Great Day.—During the fair many days were set aside and honored with special ceremonies. Various national organizations gathered

at times specified for their coming. Foreign nations sent their representatives on certain days, which were celebrated with appropriate exercises. The States of the Union had their days. Supreme above these was Chicago's day. Oct. 9, the twenty-second anniversary of the great fire that devastated that city, was appropriately chosen as the time to show the world how the effects of that event had become only a memory. A new and more beautiful city had taken the place of that which had previously existed.

Early in the morning the railway trains from Van Buren Street began running with three minutes' headway and with added facilities of cable, elevated, and horse cars. When the gates opened to the exposition grounds 15,000 persons were waiting for admission. As the morning gave way to noon-time, and the afternoon passed into evening, the crowd increased, until at the closing of the gates, when the returns were made up, it was found that 716,881 persons paid their way into the grounds. By way of comparison it may be noted that at Philadelphia in 1876 217,526 was the greatest attendance on any one day, and at Paris in 1889 the greatest day brought only 397,150 visitors. The day was celebrated with appropriate exercises.

The first event arranged by the World's Fair Com-

THE GENIUS OF THE LOCOMOTIVE GROUP.

delivered by the following representatives of foreign nations: Spain, Duchess de Veragua; Italy, Countess di Brazza; England, Mrs. Bedford Fenwick; Scotland-Ireland, Duchess of Aberdeen; Russia, Princess Schachoffsky. The hymn "America" and a benediction brought these exercises to a close. The golden nail which marked the completion of the Woman's Building at the exposition was of gold, silver, and copper, with a Montana sapphire set in the

mittee of the Chicago Common Council took place at 9 o'clock, and was in commemoration of Chicago's birth and early history. The old Potawatamie chief, Simon Pokaron, whose father, Leopold, deeded the land upon which Chicago is built, had been induced to come from his home in Hartford, Mich., for Chicago day. He stood beside the Columbian bell with uncovered head in the dress of the white man, and received the homage of thousands. He was born sixty-

three years ago Sept. 27 last, on the day that the transfer deed was delivered to the agents of the United States Government.

By his side stood the most picturesque figure among more than 500,000 people. His dress consisted of a heavy and varied coat of paint on his face, body, and limbs, a headdress of feathers, and a breech clout of beaded buckskin. He wore moccasins, and looked a typical Indian on the war path, although he came with a message of peace, standing as a historic figure between the Chicago of yesterday and the Chicago of today. He was Chief John Young, sixty years of age, who came from the Pottawattamie reservation, near Miles, Mich., to tell the people of all nations that his father, who bore the same name, christened the World's Fair city "Chicago," which, literally interpreted, means "where the skunk dwells." These two old and feeble Pottawattamie chiefs were the idols of the hour.

The exercises at Jackson Park began at noon with the booming of cannon. Then a silence fell on the multitude as the "Heralds of Peace," attired in their gaudy costumes, began their fanfare of peace. These were stationed on the Peristyle, Administration Building, Manufactures Building, and Agricultural Building. They all turned toward the Goddess of Liberty, and played on their brazen instruments "Peace on Earth, Good Will to Men." After which 3,000 voices sang "The Star-Spangled Banner." Elsewhere occurred the ringing of the new liberty bell by Mayor Harrison, accompanied by a blare of trumpets and crash of drums by the united bands. The chorus sang "Die Wacht am Rhein," "Marseillaise," the Austrian hymn, the Russian hymn, the "Star-Spangled Banner," and other national and patriotic hymns.

At 2 o'clock 400,000 persons were in the grounds. Then the "Reunion of the States" took place on the plaza facing the Court of Honor. As the States passed in review around the Court of Honor, represented by 3,000 school children, cheer after cheer attested the gratification of the vast audience. The review was divided into five sections. The first was led by a chorus of 100 boys from the diocesan choir, followed by 84 youths, one selected from each ward of the city, bearing a shield with the word "Welcome" inscribed upon it, representing the metropolis of Illinois. Then came thirteen young ladies representing the original States. A company of twenty-four boys dressed in the Continental uniform contrasted pleasantly. Then followed the States of the Union, the six principal cities of each State represented by maidens bearing pennants. The States were in the order of their admission to the Union.

In the evening a procession of twenty-five great floats illustrating the arts, sciences, peace, war, Chicago, and the nations, followed by an elaborate display of fireworks, took place. The fireworks were among the finest ever given. The special designs included old Fort Dearborn, Chicago welcoming the World, Old Glory, Niagara Falls, and the burning of Chicago. The latter was 14,000 square feet in area, in four scenes, showing Mrs. O'Leary's cow, the kicking over of the lamp, and the burning of the city.

Of decided interest was also the observance of

Manhattan's day. New York city had hoped to have the World's Fair, but her young rival carried off the prize. For a time the inhabitants of the Empire City, piqued at their loss, failed to visit the fair, but with the waning of autumn

THE REPUBLIC

they more than made good their early apathy. It was in consideration of these facts that special efforts were made to make Oct. 21 (Manhattan's day) a great success. Mayor Harrison welcomed the 10,000 visiting New Yorkers, and Horace

Porter and Chauncey M. Depew were there to respond. At the formal exercises Thomas F. Gilroy, Mayor of New York city, and Seth Low, President of Columbia College, took part, and the formal reception closed with a benediction by Archbishop Corrigan. Parades by day and pageants by night, closing with fireworks, were included in the ceremonies.

Attendance.—The number of paid admissions to the Columbian Fair during the 179 days that it was open to the public was 21,477,218, being an average of 119,984 per day. The total attendance, including exhibitors and others who held passes, was 27,529,400, which exceeded by nearly a million the 26,538,543 of the total admissions to the Paris Exposition during the months ending with October.

The attendance for May was only 1,050,067. Taking out the 128,965 of the opening day and the 115,578 of Decoration Day, the average for the other twenty-six days was only 30,960. The

9th, when the Californians, the Grand Army of the Republic, Utah, the stationary engineers, and the exponents of transportation joined in celebrating. On three other days the record went above 200,000—namely, the 23d, being Knights of Honor day, with 215,648; the 7th, by Pennsylvania and Brazil, with 203,460; and the 16th, with 202,376, that being Texas, Railway, and New Mexico day. October brought 6,816,435 visitors, or an average of 227,214 for each day, which was less than one third of the 716,881 persons who paid their way on the twenty-second anniversary of the Chicago fire. On each of three other days the record exceeded 300,000, the 10th being North Dakota and Firemen's day, and the 11th, which was Connecticut day, both rising above 309,000. Making due allowance for duplications by persons who paid more than one visit to the fair, it may be estimated that twelve million different individuals went there within the six months.

Police Service.—No large gathering of people such as collected daily at Jackson Park could be expected to escape the annoyance of petty thieving. For the protection of the visitor, the Secret-Service Bureau of the World's Columbian Exposition was organized September 1, 1892; and ex-Police Inspector John Bonfield, formerly of the Chicago department, was given charge. He consulted with city and State officials throughout the United States and Europe, and mapped out a plan for the protection of visitors, and on May 1, 1893, he had a force on the grounds of 300 picked men, coming from every State in the Union, England, Canada, and South America.

TEXAS STATE BUILDING.

paid attendance for June was two and a half that of May, but its 2,675,113 included only five days the figures for which exceeded the six months' average. In July that average was first exceeded, on the 4th, with a total of 283,273, and on the 20th the average was again passed, with a total of 129,873, by the Swedish celebration. The total (3,790,263) for that month but slightly exceeded the record for June. The 3,515,493 of August was an increase of one fourth. The paid attendance for each of fifteen days exceeded the average, and except Sundays the lowest figures were 80,200. The "banner day" in August was the 24th, when 243,951 persons paid their way through the gates to join in celebrating Illinois day. The other two largest records of August were 168,861 for the 19th, which was British day, and the 168,036 of the 25th, which was Machinery day. September brought an increase to nearly 4,660,000, its best day being the 281,523 for the

The records show 845 arrests, 400 convictions, and 105 acquittals; 297 persons were arrested for pilfering from exhibits and released on paying for the goods they had taken; 33 persons were arrested for attempting to gain admission to the grounds on fraudulent passes; 9 persons were arrested for attempting to pass counterfeit money; 143 ex-convicts were taken in and removed from the grounds, and cautioned if they were again found in the grounds they would be prosecuted; 1,395 showcases in the different exhibits were found open and not locked, through the carelessness of exhibitors or their employees; 300 stolen souvenir tickets were recovered from a gateman; value of property reported stolen, \$32,988; value of property recovered and returned to owners, \$31,875. The Secret-Service Department had charge of the lost and found articles up to the 19th of August, when it was turned over to the auditing depart-

MISSOURI STATE BUILDING.

ment. The number of articles found by secret-service officers and returned to owners was 861, the value being \$11,881. The Secret-Service Bureau went out of existence on Dec. 1.

Cost of the Fair.—The total cash receipts of the exposition from all sources up to and including Nov. 12 were \$33,290,065.56, while the disbursements were \$31,117,353.79. In the month of May there were 11,432 persons on the pay rolls of the fair and their total compensation was \$387,492.80, exclusive of the amount paid to the 7,000 men employed by contractors.

The average receipts a day during the six months it was open were \$89,501.53, and the average expenses a day were \$18,380.59. The smallest attendance was on May 5, 10,791, and the largest on Chicago day, Oct. 9, 729,203. The total number of paid admissions for the six months was 21,530,854.

The disbursements represent the money paid out for landscape gardening and architecture; dredging, filling, and excavating; coloring and decorating; draughtsmen's wages; electric plant; interior docking; grading and surveying; piers and breakwaters; roadways and sidewalks; sculpture modeling; statues; water and sewerage; horses, wagons, and harnesses; the various exhibition buildings; and other items too many to mention.

From these results it is expected that when the Committee on Finance make their final report they will be able to announce a dividend of 10 per cent.

For the six-month exposition period the receipts and expenses were:

1893.	Receipts.	Expenses.
May.....	\$606,140 61	\$593,737 20
June.....	1,647,644 44	690,585 20
July.....	1,967,194 84	599,819 97
August.....	2,937,856 25	569,799 19
September.....	3,169,988 92	537,566 93
October.....	4,402,467 85	610,000 06
Total..	\$14,141,342 41	\$3,504,087 41

The receipts are thus summarized:

Balance from temporary organization.....	\$4,252 64
Installment receipts in stock.....	10,516,898 45
Interest on deposits.....	69,090 59
Sale of souvenir coins.....	\$1,094,144 75
	1,438,000 00
Gate receipts.....	2,329,144 78
Receipts from <i>concessionaires</i>	10,878,145 41
Sale of bonds.....	3,854,016 28
Accrued interest on bonds.....	4,444,500 00
Miscellaneous receipts.....	20,976 52
	1,794,229 67

Total receipts..... \$33,290,065 56

In addition to this total the following appropriations were made:

By foreign governments.....	\$2,571,520 00
By States of the Union.....	6,020,850 00
By the United States Government (exclusive of amounts in former account).....	2,609,875 00
Total.....	\$15,251,254 00

Awards.—The Executive Committee of Awards consisted of the following State commissioners:

John Boyd Thacher, of New York, A. T. Britton, of the District of Columbia, A. B. Andrews, of North Carolina, A. J. Sewell, of New Jersey, and B. B. Smalley, of Vermont. This body devised a system of awards, the basis of which was a standard of excellence established in each class of exhibits, the merits of the exhibits to be measured by that standard, and not by competition with each other. For the carrying out of this there were 852 judges appointed, who were distributed through the several departments in proportion to their magnitude.

Medals were awarded to 23,757 exhibitors, 36 per cent. of the whole number catalogued, exclusive of those from France and Norway, who withdrew their exhibits from examination. This was a smaller percentage of exhibitors thus honored than the records of any previous world's exposition show. Over 250,000 separate exhibits were examined and reported upon.

There were 65,422 exhibitors, and although the system of awards met with considerable adverse criticism, still only 259 complaints were submitted in any form against the awards, and out of that number only 43 cases resulted in actual appeals. Of these appeals, all have been adjusted excepting 5. In each of them the tes-

History.—The usual official report of the exhibition is in course of preparation under the direction of O. V. Tousley, a commissioner from Minnesota, who was appointed historian of the World's Fair. It is estimated that the work will consist of 30 octavo volumes of 500 or 600 pages each. It will include an introduction or preface to the history, which will deal with the events which led up to the establishment of the fair and the acts of Congress authorizing it, and include a review of the industrial and educational advantages resulting from it.

This will be followed by the report of President Palmer, which will contain a history of the opening ceremonies, and deal with the exhibitions made by the United States and foreign nations. The report of the secretary will include synopses of the legislation of the commission, the work of the Board of Control and the Executive Committee, and a full financial statement. The report of the Council of Administration will cover the erection of the buildings and the manner in which the fair was conducted in all its details. There will be separate reports of the Board of Lady Managers, the Chicago Directory, and the director-general. The latter will include a report from the heads of each of the

COLORADO STATE BUILDING.

timony has been taken, the arguments submitted, and the 5 cases are in the hands of the Court of Appeal awaiting judgment.

The medals are all of bronze, designed by Augustus St. Gaudens, and the accompanying diplomas were designed by Will H. Low. They are being made under the authority and direction of the Secretary of the Treasury.

18 departments into which the exhibition was divided.

The report of the Executive Committee on Awards will be made by John Boyd Thacher, the chairman, and will occupy 15 volumes. The preparation of the reports of the congresses held during the fair has been intrusted to Mr. Butterworth.

World's Congress Auxiliary.—Beginning on May 15, there were held a series of congresses at the Memorial Art Palace in Chicago, under the direction of a committee consisting of Charles C. Bonney, president; Thomas B. Bryan, vice-president; Lyman J. Gage, treasurer; and Benjamin Butterworth and Clarence E. Young, secretaries. The woman's branch was under the management of Mrs. Potter Palmer, president, and Mrs. Charles Henrotin, vice-president. The purpose of these congresses was to bring together the leaders of human progress from the various countries of the world during the season of the World's Columbian Exposition in order to review the achievements that have already been made in the various departments of enlightened life, and sum up in each the progress of the world in the department involved to the date of the Congress: to make a clear statement of the living questions of the day that still demand attention, and to receive from eminent representatives of all interests, classes, and peoples suggestions of the practical means by which further progress may be made and the prosperity and peace of the world advanced.

The congresses were as follow: 1. Department

Woman's Christian Temperance Union, International Kindergarten Union, Women's National Indian Association, National Association of Loyal Women of American Liberty, National American Woman Suffrage Association, Women's Baptist Home Mission Society, General Federation of Women's Clubs, American Protective Society of Authors, Women's Centenary Association, Catholic Women's Department Congress, National Alliance of Unitarian and other Liberal Christian Women, Women's Western Unitarian Conference and Women's Unitarian Conference of the Pacific Coast, National Women's Relief Society, Young Ladies' National Mutual Improvement Association, National Society of the Daughters of the American Revolution, Women's Trades Unions, National Columbian Household Economic Association, and Association of Collegiate Alumnae.

2. Department of Public Press, under the presidency of William P. Nixon, during the week May 22-28. It included the following department congresses: Daily and General Newspapers, Press Women of the World, American Newspaper Publishers' Association, Religious Press, Trade Press Congress.

MAINE STATE BUILDING.

of Woman's Progress, under the presidency of May Wright Sewell, during the week May 15-21. It included the following department congresses: National Council of Women of the United States, International Council of Women, Order of the Eastern Star, International Committee of Young Women's Christian Associations, National Christian League for the Promotion of Social Purity,

3. Department of Medicine, including congresses of Eclectic Physicians and Surgeons, under the presidency of Dr. Milton Jay; Homoeopathic Physicians and Surgeons, under the presidency of Dr. J. S. Mitchell; and Medicoclimatology, under the presidency of Dr. T. C. Duncan, during May 29 to June 3.

4. Department of Temperance, under the presi-

THE COURT

PLACE OF HONOR.

IDAHO STATE BUILDING.

dency of Albert G. Lawson, during June 5-10. It included the following department congresses: National Temperance Society, Sons of Temperance, Catholic Temperance Societies, Woman's Christian Temperance Union, Non-Partisan National Woman's Christian Temperance Union, Royal Templars of Temperance, Independent Order of Good Templars, American Medical Temperance Association, and Vegetarian Congress.

5. Department of Moral and Social Reform, under the presidency of Mrs. James M. Flower, during June 7-19. It included the International Congress of Charities, Correction, and Philanthropy, embracing sections on The Public Treatment of Pauperism; The Care of Neglected, Abandoned, and Dependent Children; The Hospital Care of the Sick, the Training of Nurses, Dispensary Work, and First Aid to the Injured; The Commitment, Detention, Care, and Treatment of the Insane; The Prevention and Repression of Crime and the Punishment and Reformation of Criminals; The Organization and Affiliation of Charities in Countries, States, Cities, Towns, and Villages, and Preventive Work among the Poor; and The Introduction of Sociology as a Special Topic of Investigation and Instruction in Institutions of Learning; also The International Order of the King's Daughters and Sons, Nurses' Associations, Humane Associations, and Waif Savers.

6. Department of Commerce and Finance, under the presidency of Lyman J. Gage, during June 19-24. It included department congresses of Bankers and Financiers, Railway Commerce Congress, Congress of Boards of Trade, Life In-

surance Congress, Fire Insurance Congress, Mutual Life and Accident Underwriters, and Mutual Benefit and Assessment Congress. Congress on Mercantile Credits. World's Railway Commerce Congress, under the presidency of G. R. Blanchard, met from June 19 to June 24. United States League of Local Building and Loan Associations, under the presidency of Seymour Dexter, met from June 27 to June 30.

7. Department of Music, under the presidency of Theodore Thomas, during July 3-10, including meetings of the American College of Musicians, Music Teachers' National Association, Woman's Musical Congress, Illinois Music Teachers' Association, with special congresses on musical education, music journalism, Indian and folk song music.

8. Department of Literature, including Congress of Authors, Congress of Historians and Historical Students, Congress of Librarians, Congress of Philologists (including American Philological Association and Modern Language Association of America), American Dialect Society, and Folk-Lore Congress, met during the week beginning July 10.

9. Department of Education, including department congresses of College and University Students, Manual and Art Education, Kindergarten Education, Instructors of the Deaf, General Education, Representative Youth, University Extension, Deaf-Mutes, Educators of the Blind, Chautauquan Education, College Fraternities, Social Settlements, Emma Willard Memorial Association, Stenographers, Higher Education, Women Stenographers, met from July 17 to July 24. Also

the Business and Commercial College Congress met during July 25-28, and at the same time the National Educational Association, the American Association of Educators of Colored Youth, and the National Geographic Society held special meetings.

10. Department of Engineering, under the presidency of E. L. Cortheil, met during the week beginning July 31. It included congresses in Civil Engineering, in charge of the American Society of Civil Engineers; Mechanical Engineering, in charge of the American Society of Mechanical Engineers; Mining Engineering, also

11. Department of Art held congresses during the week beginning July 31 on Architecture, Photography, Ceramic Art, Painting and Sculpture, and Decorative Art, with contemporaneous meetings of the American Institute of Architects.

12. Congresses on Jurisprudence and Law Reform, with Henry W. Rogers as chairman; on Civil Service Reform, with Leroy D. Thoman as chairman; on City Government, with Walter Q. Gresham as chairman; on Suffrage, with Thomas W. Palmer as chairman; and on Arbitration and Peace, with Josiah Quincy as chairman, were held during the week beginning Aug. 7.

13. Congresses on Africa, with James E. Roy as chairman; on Dentistry, with Dr. L. D. Shepard as chairman; on Medical Jurisprudence, with Clark Bell as chairman; on Horticulture, with P. J. Berckmans as chairman, were held during the week beginning Aug. 14.

14. Department of Science and Philosophy, including congresses on Psychical Science, with Elliott Coues as chairman; on Philosophy, with R. N. Foster as chairman; on Geology, under the auspices of a committee of the American Association for the Advancement of Science, with Thomas C. Chamberlain as chairman; on Pharmacy, under the auspices of the American Pharmaceutical Association; on Chemistry, under the auspices of the American Chemical Society and the chemical section of the American Association for the Advancement of Science, with Harvey W. Wiley as chairman; Meteorology, Climatology, and Terrestrial Magnetism, with Mark W. Harrington as chairman; on Electricity, under the chairmanship of Henry A. Rowland; and on Mathematics and Astronomy, with George W. Hough as chairman; on Anthropology, with Daniel G. Brinton as chairman; on Zoölogy, with Stephen A. Forbes as chairman, met during the week beginning Aug. 21.

15. Congresses of the Jewish Denomination, with B. Bettman as chairman; on Social and Economic Science, with John H. Gray as chairman; on Labor; on Single Tax, with Joseph T. Ripley as chairman, met during the week beginning Aug. 28.

16. Religion. Beginning with the Jewish Church Congress on Aug. 27, there were subsequently held congresses of the following denominations: Evangelical Lutheran, Catholic, Colored Catholic, Jewish Women, Congregational Church, Lutheran General Synod, Universalist Church, Disciples of Christ, New Jerusalem Church, United Brethren Church, Advent Christian Church, Reformed Episcopal Church, Lutheran Women, Theosophists, Seventh-Day Baptist, Presbyterian Church, Unitarian Church, Friends, Christian Scientists, Free Religious Association, Reformed (Dutch) Church, African Methodist Episcopal Church, Friends (orthodox) Church, German Evangelical Synod of North America, Methodist Episcopal, Swedish Evangelical Mission Covenant, Buddhists, Cumberland Presbyterian Church, Evolutionists, Sunday Rest, Ethical Societies; besides which, and in conjunction with the proper denominations or sects, meetings were held of the Catholic Truth Society, Societies of St. Vincent de Paul, German Catholic Young Men's Guilds, Catholic Benevolent Legion, Catholic Young Men's National

A BIT IN EGYPT.

Metallurgical Engineering, in charge of the American Institute of Mining Engineers; Engineering Education; Military Engineering; and Marine and Naval Engineering. Also an Aërial Navigation Conference and a Water Commerce Congress met during Aug. 1-5.

Union, Catholic Press, Students of the American College of Louvain, Catholic Young Men's Societies, Christian Endeavor, Evangelical Association, Young Women's Christian Association, King's Daughters and Sons, closing finally with

American Public Health Association, a Congress on Public Health, with Dr. S. H. Durgin as president, was held during Oct. 10-14.

18. Department of Agriculture, under the presidency of Samuel W. Allerton, including

special congresses on Missions and a meeting of the Christian Alliance. The gathering of these bodies continued until Oct. 15.

17. A Congress on Patents and Trade-Marks, under the presidency of Henry W. Blodgett, began on Oct. 2, followed by that of the Evangelical Alliance on Oct. 8, under the presidency of William E. Dodge. A Humane Congress, with John G. Shortall as presiding officer, was held during Oct. 11-13, and under the auspices of the

special congresses on Fisheries, Veterinary Surgery, Good Roads, Household Economics, Farm Life and Mental Culture, Agricultural Education and Experiment, Ornithology and Forestry, was held during the week beginning Oct. 16.

19. A Second World's and Twentieth National Convention of the Woman's Christian Temperance Union was held during Oct. 16-21, followed by a World's Real-Estate Congress during Oct. 23-25, and the final session of the World's Con-

A BIT OF OLD VIENNA.

gresses, presided over by Mr. Bonney, was held on Oct. 28.

According to an official report of the secretary, there were 210 working committees, a local membership of 1,600, and a nonresident membership of 15,000. In preparation for these congresses there were sent out over 1,000,000 circulars. There were held 1,245 sessions, with 5,974 speakers, and a total attendance of over 700,000. It will require 50 volumes of 600 pages each to contain the published proceedings, papers, and addresses.

The End.—It was the intention of the officials of the World's Fair to make the closing day an event second in importance and interest to the opening. With this end in view, elaborate preparations had been undertaken, but at the last moment all ceremonial exercises were abandoned, and the fair closed quietly and in sadness. Two days before the end the bullet of an insane assassin killed Mayor Harrison, and in respect to his memory the programme was canceled.

The closing ceremony took place in Festival Hall on Oct. 30 at 1 p. m., when President Palmer said:

It was intended that the speeches of to-day should be of a joyous character; that the closing ceremonies of the World's Columbian Exposition of 1892 and 1893 should be attended with festivities, the firing of cannons, the music of bands, the making of speeches,

and song. But a terrible tragedy has intervened to bring sorrow to the city of the fair and to the world as represented here. The mayor of that city which has done so much for this exposition has been shot down by an assassin in the portals of his home. His every heartbeat pulsated with love for the city and interest in the exposition. In view of this catastrophe, it is deemed proper that the programme of festivities should be omitted, and the exercises consist only of prayer, the reading of resolutions of condolence, and the benediction.

A prayer by Dr. Barrow, of Chicago, followed, after which, in a brief speech, President Higinbotham offered resolutions expressing the obligations of the fair to Hon. Carter Harrison, Mayor of Chicago and a director of the exposition, and sorrow for his death. (See page 371 of this volume.)

A benediction followed, and the sharp sound of the gavel of President Higinbotham brought the World's Columbian Exposition to a close. The funeral marches of Chopin and Beethoven were played on the great organ as the crowd dispersed.

At sunset, 4.45 o'clock, the colors of all nations, which had been flying at half mast since sunrise on Sunday, were lowered together, and at the word of command from artillery officers the guns of a battery facing the water of the lake gave the signal telling the world that with the sinking of the sun the World's Fair had come to an end.

VIEW OF ADMINISTRATION BUILDING, SEEN FROM THE NORTH ELECTRICITY BUILDING ON THE LEFT, MINES BUILDING ON THE RIGHT.

WYOMING, a Northwestern State, admitted to the Union July 10, 1890; area, 97,890 square miles; population in 1890, 60,705. Capital, Cheyenne.

Government.—The following were the State officers during the year: Governor, J. E. Osborne, Populist; Secretary of State, Amos W. Barber; Auditor and Insurance Commissioner, C. W. Burdick; Treasurer, Otto Grumm; Attorney-General, C. N. Potter; Adjutant-General, F. A. Stitzer; Chief Justice, H. V. S. Groesbeck; Clerk of the Supreme Court, R. H. Reputh; Superintendent of Public Instruction, S. T. Farwell.

Finances.—The Auditor's biennial estimate of the revenue for the two years ending March 31, 1895, is as follows: General fund, \$250,000; Capitol tax, \$8,064; university tax, \$8,064; the fund for the insane, \$24,193; State bond tax, \$38,400; Capitol building fund, rents, \$6,500; Deaf, Dumb, and Blind Asylum, rents, \$250; insurance fees, \$5,000; Building and Loan Association fees, \$350; register State Land Board, fees, \$800; Secretary of State, fees, \$1,500; clerk of Supreme Court, fees, \$200; common school, \$30,000; buildings at State capital, \$500; university, \$1,500; blind, deaf, and dumb, \$1,000; Insane Asylum, \$2,000; fish hatchery, \$200; other land funds, \$3,000; revenues from permanent land funds, \$3,000; total estimated revenue, \$384,521.

His estimate of the expenditures is as follows: Appropriations, \$271,545; Capitol maintenance and improvement, \$14,500; State University, \$8,064; State Insane Asylum, \$24,193; interest on State bonds, \$38,400; common schools (land income), \$30,000; other State institutions (land income), \$2,500; institutions receiving revenue from the permanent land funds, \$2,500; total estimated expenditures, \$391,702.

Taxation.—The various rates at which the assessments for State revenue are made are as follow: General fund, $8\frac{1}{2}$ mills; Capitol tax, $\frac{1}{4}$ mill; university tax, $\frac{1}{4}$ mill; fund for the insane, $\frac{1}{4}$ mill; bond tax, $\frac{1}{4}$ mill; total rate, $5\frac{1}{2}$ mills. The rate of taxation in the different counties varies from $9\frac{1}{4}$ mills to $21\frac{1}{4}$ mills. This does not include school-district levies or municipal-tax levies. Exemption from taxation is as follows: Property of United States, State, counties, school districts, municipal corporations, and public libraries; lots with buildings thereon used exclusively for religious worship, church parsonages, public cemeteries, grounds and buildings of literary and scientific institutions incorporated under State laws; grounds and buildings of benevolent, agricultural, and religious societies, used solely by them, not exceeding 3 acres in extent, or the revenue devoted solely to such objects; household furniture, not to exceed \$100; polls of all persons over fifty years old.

Indebtedness.—The total bonded indebtedness is \$320,000. The issues are: Capitol-building bonds, \$150,000, one tenth payable in 1901 and one tenth each year thereafter; university bonds, \$50,000, same as preceding; Insane Asylum bonds, \$30,000, one tenth in 1912 and one tenth each year thereafter; public buildings, \$90,000, one tenth payable in 1918 and one tenth each year thereafter. The interest on all these bonds is at 6 per cent. As a basis for this indebtedness the State owns, without other incumbrance, pub-

lic buildings and grounds costing \$491,855.30 and the Penitentiary, at Laramie, which was donated to the State under the Admission act, and is valued at about \$70,000, making a total of \$561,855.30.

Banks.—An abstract of the statement of the condition of the national banks, Dec. 19, 1893, shows: Total specie, \$311,155; individual deposits, \$2,080,018; loans and discounts, \$2,312,823; surplus fund, \$162,900. The reserve is 35-75 per cent., as against 22-97 per cent. Oct. 3.

State Buildings.—The cost of each of the public buildings of the State was as follows: Capitol building, Cheyenne, \$295,649.59; University building, Laramie, \$30,753.95; Insane Asylum, Evanston, \$66,134.66; Poor Asylum, Lander, \$5,053.39; Penitentiary, Rawlins, \$31,844.41; Deaf, Dumb, and Blind Asylum, Cheyenne, \$7,919.30; fish hatchery, Laramie, \$4,500.

Public Lands.—During the year Wyoming received \$4,439.40 as its 5 per centum on the sale of public lands. The number of acres of public land vacant in the State July 1, 1893, was 53,403,164; the forest reservation was 1,239,040 acres; the Indian reservation, 1,818,000 acres.

Wealth.—The estimated population of the State on June 1, 1892, was 74,000; the capital was \$4,890,896. About 80 per cent. of the farms are cultivated by owners; 13 per cent. of these farms are subject to a total incumbrance of \$455,061, which is 35 per cent. of their value. The average rate of interest is 10-92. About 38 per cent. of the nonfarming population own their homes, 14 per cent. of them being subject to incumbrances aggregating \$589,238, or 42 per cent. of their value. Each owned and incumbered farm, on the average, is worth \$3,600 and is subject to a debt of \$1,247.

Education.—The University of Wyoming employed 14 instructors and enrolled 120 pupils. The buildings and grounds are valued at \$150,000, and the library contains 2,300 bound volumes. The public schools, with an enrollment of 9,426 pupils, employed 367 teachers. The average number of days in the school year was 120, and the average daily attendance 6,110.

Live Stock.—Wyoming shipped 94,295 head of cattle during 1893. The Stock-Growers' Association reported its financial condition for the year ending March 31, 1893, as follows: Balance on hand March 31, 1892, \$822.35; receipts, \$704.96; disbursements, \$209.50; balance in treasury, \$1,362.05.

Legislative Session.—The Legislature convened on Jan. 2, and adjourned on Feb. 23. Comparatively little business was transacted. Among the acts of the session are the following:

To protect employees of corporations, companies, or individuals, or other persons nominated as candidates at any election, in their rights as citizens.

Providing for and adopting a great seal of the State.

Providing for the levying of and collecting a tax of three fourths of a mill for the year 1893, and one fourth of a mill for the year 1894, for the erection, equipment, management, and conduct of a miners' hospital at Rock Springs.

Providing for an allowance of good time, discharge money, and clothing to State convicts.

Fixing State senatorial and representative districts, and determining the legislative representation thereof.

Ceding to the United States jurisdiction over certain military posts and lands and the Shoshone Indian reservation.

Prescribing the age at which deaf and dumb children may be admitted as pupils in the Blind, Deaf, and Dumb Asylum as State charges.

Amending an act entitled An Act regulating voluntary assignments and for other purposes, approved March 13, 1890.

Joint memorials were sent to Congress praying for the submission of a constitutional amendment providing that United States Senators shall be elected by a vote of the people, and desiring Congress to enact laws to restore silver to the position occupied in the currency of our country prior to the demonetization act of 1873.

No Senator was elected by the Legislature of 1893 to succeed the Hon. Francis E. Warren, (Republican). After the expiration of his term the Governor appointed A. L. Beckwith, who resigned before the United States Senate had taken final negative action on similar appointments, and so until the next meeting of the Legislature the State remains with but one representative in the Senate.

Woman Suffrage.—The following concurrent resolution was unanimously adopted by the Legislature:

Resolved, By the second Legislature of the State of Wyoming, that the possession and exercise of suffrage by the women in Wyoming for the past quarter of a century has wrought no harm and has done great good in many ways; that it has largely aided in banishing crime, pauperism, and vice from this State, and that without any violent or oppressive legislation; that it has secured peaceful and orderly elections, good government, and a remarkable degree of civilization and public order, and we point with pride to the facts that after nearly twenty-five years of woman suffrage not one county in Wyoming has a poorhouse, that our jails are almost empty, and crime, except that committed by strangers in the State, almost unknown, and as the result of experience we urge every civilized community on the earth to enfranchise its women without delay.

Resolved, That an authenticated copy of these resolutions be forwarded by the Governor of the State to the Legislature of every State and Territory in this country, and to every legislative body in the world; and that we request the press throughout the civilized world to call the attention of their readers to these resolutions.

Y

YACHTING. The preliminary conditions of yachting for 1893 pointed early in the year to an unprecedented rivalry between the two great maritime nations of the world, and the promise was borne out in the construction of a fleet of sailing craft the like of which has never been afloat before. The series of international sailing races that followed on both sides of the ocean place the year easily at the head of the yachting calendar, and, in view of the increasing use of propulsive machinery for pleasure craft, it seems probable that the sailing yacht has reached the zenith of its popularity, though not by any means its ultimate perfection in build and equipment.

This culmination of interest in a noble and manly sport that trains seamen and officers for the ships of two great nations is due to the inauguration of international yacht racing by a company of New York yachtsmen, who in 1851, the year of the first World's Fair in London, sent the schooner-yacht "America" to try conclusions with the Royal Yacht Squadron. Her sailing powers were so undeniably superior to everything that the English could bring forward that she can hardly be said to have had an official chance to demonstrate them. However, she brought home the trophy now known as "The America's Cup," which is by common consent recognized as the emblem of the world's yachting supremacy.

English yacht architecture was largely modified in model and rig from the example set by the "America." Sails were cut to set flat, masts were sharply raked, and entrance lines were made longer and finer. English designers, however, continued to build their boats narrow and deep rather than broad and shallow, as was the tendency in America.

Nineteen years passed before an attempt was made to win back the cup, and during that time English designers had worked out results that

introduced wide divergence from the American type both in schooners and in "single stickers," as has come to be the common designation of sloops and cutters. The diagrams given herewith show all English challengers and all the American cup defenders with their respective midship sections. The lines are necessarily drawn to such a small scale that they must not be accepted as absolutely accurate. Some of them are off-hand sketches from models, and others are from official lines. They are merely intended to serve for purposes of comparison.

It should be explained here that in 1876 and 1881 Canadian yachts challenged for the cup—namely, "The Countess of Dufferin" (schooner) and "Atalanta" (sloop). They were easily defeated respectively by "Madeline" and "Mischief," and the only interesting incident in connection with the two matches is that the Canadians had the honor of sailing the last schooner race and beginning the list of sloops. Diagrams of these yachts are omitted because they were not British types, and had no influence upon the development of yacht architecture.

Nine large "single stickers"—5 American and 4 British—were built for the season of 1893, the exciting cause being cross challenges by the Earl of Dunraven for the "America's" cup and by Mr. Royal Phelps Carroll, of New York, for the "Victoria" gold cup. America was represented by "Navahoe," "Vigilant," "Colonia," "Jubilee," and "Pilgrim"; Great Britain, by "Valkyrie," "Britannia," "Satanita," and "Calluna." All were of the 90-foot class, the largest single-stick yachts ever constructed. They all had the new overhanging bows. "Pilgrim" and "Jubilee" were of the fin-keel type, but did not distinguish themselves, owing, perhaps, to lack of experience in the management of this class of vessel. "Navahoe" failed to capture the prize for which she crossed the ocean, though she won

several races, and, upon the whole, made a better record than she is given credit for.

"Valkyrie" was fairly beaten by "Vigilant" in the races for the "America's" cup off New York in October.

Shortly after the "Volunteer" and "Thistle" contest the Herreshoff Brothers, of Bristol, R. I.,

began to deviate from the regular profile and smooth continuous curves traditional with designers. "Vertical" and "clipper" stems gave way to the "overhang" or "shovel-nose" type, and successful experiments were made with "fin" and "bulb" keels. These last bid fair to play a prominent part in the future.

GARMITA (BULB FIN CUTTER) 1888:

MISCHIEF (SLOOP) 1872.

First race, 1851. Round the Isle of Wight, England. (I) Schooner yacht "America" against the Royal Yacht Squadron. (A = a type of the British schooner yacht of that time.)

Second race, 1870. New York Bay. British schooner yacht "Cambria" (B) against the New York Yacht Club Squadron. "Magic" (II) led the fleet.

Third race, 1871. New York Bay. British schooner yacht "Livonia" (C and D) against American yachts "Columbia" (III) and "Sappho" (IV).

Fourth race, 1876. New York Bay. Canadian schooner "Countess of Dufferin" against American schooner "Madeline."

Fifth race, 1881. New York Bay. Canadian sloop "Atalanta" against American sloop "Mischief."

Sixth race, 1885. Off New York. British cutter "Genesta" (E) against American sloop "Puritan" (V).

Seventh race, 1886. Off New York. British cutter "Galatea" (F) against American sloop "Mayflower" (VI).

Eighth race, 1887. Off New York. British cutter "Thistle" (G) against American sloop "Volunteer" (VII).

Ninth race, 1888. Off New York. British cutter "Valkyrie" (H) against American sloop "Vigilant" (VIII).

"Mischief," the crack sloop of her day, was a conspicuous example of the center-board sloop. "Carmita" was launched in 1893, and was the first large boat of her type. Her lines are kindly furnished by her owner, Mr. C. H. W. Foster. She was designed by Waterhouse & Cheesborough, and has made a fairly good showing for a new boat. The black indicates a cigar-shaped lead bulb, bolted to the edge of her fin. There is an obvious likeness between the cross sections of the two boats, and if "Mischief's" "deadwood" were cut away along the dotted line the resemblance would be still closer. The fin keel is, in fact, a fixed center board, and the canoe-shaped under body is an aggravated form of what was formerly termed a "skimming dish."

At first sight it would seem that the fin keels are essentially racing machines, but it is not certain that they may not prove to be able deep-water boats. The construction is simple and strong, the frames being true inverted arches for a large section of the length—an exceedingly strong form to which the two plates of the fin can be securely bolted. The fin and its bulb attachment are the heaviest part of the structure—a sort of pendulum, in fact, to which the lighter hull is attached. The canoelike body is exceedingly buoyant and easy in a sea way, and when sailing masters have learned how to handle them it is held by their advocates that fin keels will be accepted as an important improvement in scientific construction.

INDEX

TO THE EIGHTEEN VOLUMES, NEW SERIES, OF THE ANNUAL CYCLOPÆDIA.

1876 to 1893.

- Aarifi Pasha, sketch, ii, 1.
 Abba, battle at, x, 317.
 Abbe, C., observations by, iii, 84; xii, 487.
 Abbe, Prof., of Jena, ix, 502, 507-510.
 Abbot, Ezra, obit., ix, 601.
 Abbott, B. V., obit., xv, 681.
 Abbott, C. C., discovery by, vi, 19; ix, 16; xi, 28.
 Abbott, Emma, obit., xvi, 608.
 Abbott, Helen C. D., x, 45; xi, 46.
 Abbott, J. C., obit., vi, 678.
 Abbott, Josiah G., obit., xvi, 608.
 Abbott, J. S. C., sketch, ii, 1.
 Abbott, W. P., obit., iii, 681.
 Abdallah, Tashi, xii, 244.
 Abdallah, the Sheik, v, 628.
 Abd-el-Kader, sketch, iv, 1; x, 817, 818.
 Abd-el-Samet, ix, 801.
 Abdomen, the, xiii, 752.
 Abdominal section, x, 742.
 Abdul-Aziz, i, 1, 760.
 Abdul-Hamid II, i, 2; vi, 841.
 Abdul Kerim Pasha, sketch, ii, 1; x, 817.
 Abdul Melik, xi, 6.
 Abdul Munin Khan, xi, 6.
 Abdurrahman Khan, v, 1; struggle with Ayoob, vi, 3; viii, 1, 4; ix, 3, 5; x, 2, 4, 7, 12; xi, 4, 5; xii, 491.
 Abdy, Sir T. N., obit., ii, 591.
 A'Beckett, G. A., obit., xiv, 668.
 Abbel, Gustavus, obit., xii, 567.
 Abel, Frederick A., experiments by, iv, 181; theories, x, 160, 543, 574; port., xv, 81.
 Abell, Arunah S., sketch, xiii, 621.
 Abercorn, Duke of, obit., x, 655.
 Abercrombie, J. J., obit., ii, 574.
 Abercrombie, Ralph, xii, 491.
 Aberdare Mountains, ix, 847.
 Aberdeen, Earl of, port., xviii, 268.
 Aberdeen, S. Dak., xv, 118.
 Aberdeen, Wash., xvi, 145.
 Aberration, constant of, xiii, 56.
 Aboo Roash, pyramid of, ix, 21.
 About, E., obit., x, 655.
 Absentee, xiii, 1.
 Absorption of liquids through the stomach, xii, 676.
 Abt, Franz, obit., x, 656.
 Abu Hubba, inscriptions from, xii, 17.
 Abu Klea Wells, engagement at, ix, 804; x, 116, 814, 819.
 Abydos, Tablet of, vii, 257.
 Abyssinia, in volumes i, ii, iv, xi, and xii; war with Egypt, i, 8; ii, 2; iv, 2, 333; v, 236; views in, illustrations, i, 4, 5; ii, 2; provinces of, ii, 2; cession of Massowah, viii, 802; treaty, ix, 296; the Italians in, xi, 1; xii, 1; attack on them, xii, 2; conquest of Harrar, xii, 2; treaty with England, xii, 1; intercourse with Russia, xi, 1; xiii, 2; xiv, 1; xv, 1; xvi, 1; xvii, 1; xviii, 1.
